So you'd recommend one filter per band?

Thanks,
Hamish

3257. Buying antenna fedthrough insulators in the UK

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-04 11:09:48 UTC
From: Richard <nearlynews_email@ntlworld.com>
Message-ID: <b92s9u$esbph$1@ID-150848.news.dfncis.de>
Source record: 35760
Cross-posted to: rec.radio.amateur.homebrew,uk.radio.amateur

You must be able to buy antenna feedthrough insulators in UK, but I never seem to have an easy time finding suplliers of these kind of things these days.

Does anyone know who in UK might be able to supply antenna feedthroughs like those you see in the link. Or, does anyone have one or two to sell. Wants to be no more than about an inch or so diameter at the base. Like 10-79 or perhaps 10-76 in the link photos. They look just the job. TIA. Rich.

> Please email me offlist if you have one for sale.

You could use the HV supply from a _small_ TV set, with a long string of extra resistors on the HV output so
you don't get too much output current. Just an idea... It's not a precise 15kV, but nevertheless should be
10kV .. 20kV or thereabouts.

cheers,
- jfw

> stumble upon by chance.

I'm beginning to doubt that too...

Last week (ok, haven't had much time to do ham stuff...) I hooked the DDS up attenuated to an RX in place of
the antenna signal, and at least it sounds clean. Not any birdies/spurious signals nearby in the range of DDS
LO +-100kHz. Judging from the sound and some tuning around, the DDS signal has a narrow bandwidth of "at most
10 Hz". I'll yet have to check on a spectrum analyzer for the actual figures. After I get to borrow one.

> What happens when you look at a clean LC oscillator at the same frequency?

It looks clean, without erratic shifts or wobbles or waveform dents. Actually, when the DDS output signal is
buffered (an old 2n2222 in class A,*cough* .... ;-), then it looks acceptably clean too. So it isn't a
triggering problem either.

It must be some odd problem with the digital scope and the 10x probe leads. Maybe the digital scope loading on
the output messes up the DAC in some way that I'm totally ignorant of right now.

Together with the mixer boards ham band rx sounds almost ok, so further probs are then probably caused down
the mixer side and are not DDS related. I'll try to do the spectrum analyzer and second

analog scope
measurements once I finally find the time, or then I'll just believe the DDS really _is_ clean (rx sound ok,
who wants more ;-). A big thanks to everyone for the help!!! :-)

73,
- jfw

A well balanced push-pull amplifier will give some suppression
of even harmonics. Suppression of even harmonics would probably
not be good enough to meet the strict new EI regulations
introduced by ComReg in Jan 3003.

> Even if I did need to filter the second harmonic, I think I could get
> away with 80, 40/30, 20/17/15, and 12/10 for example.

That should be ok for the best case scenario, but it is
good practice to design for the worst case. You want to
have sufficient harmonic suppression, even when the
amplifier is overdriven.

I would use at least five filters, six if you want to
include 160M.

ViPEC is a handy tool for testing your filter designs.
http://vipec.sourceforge.net Unfortunately, the
current version needs QT 2.x libs.

> Finally, any suggestions on a source (online probably) for RF relays
> rated to 300W? High coil voltage is fine, the amp will be running from
> 48V.

I usually use Iskra brand SPDT 12V relays. The relay contacts
are rated at 16A. I have used them up to 300W at HF and
130W on VHF. I have also had good results with PED brand
DPDT relays with a contact rating of 10A. You want relays
with the contacts mounted on short, wide brass strips with
plenty of physical isolation between the contacts and the
relay coil. I buy mine at the local electronics shop,
I'm sure you can find some closer to home.

3261. Yet Another Panel Update

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-04 21:23:40 UTC
From: wb8rcr <wb8rcr_nospam@qsl.net>
Message-ID: <vbb1776qphfo86@corp.supernews.com>
Source record: 35764

A week or so ago, something really shocking was revealed to me ... there are amateurs out there, builders just like us, who build things using valves (tubes here in the colonies). Even more startling, stuff built with these strange devices tend to be large ... very large. Way too large to stuff in the suitcase for a business trip or to take camping. Nevertheless, there are actually people who do this stuff anyway!

When I wrote Panel, the idea of a panel over a foot long never occurred to me. 8 inches wide by 3 inches high is a BIG panel in my book. But these folks who build these enormous contraptions need panels too. One of them sent me a panel file that didn't work - of course not, it was bigger than the paper!

So, today I posted an update to Panel. The new version (3.2) will adjust the paper size to the panel. In the process of adding this feature, I discovered a bug in how Panel centers the panel on the page, so the new version is a little nicer that way, too.

Also, over the past couple of weeks, I've added a note to my web site to explain a little more about how these command line programs work for Windows users. (Another startling discovery I made recently is that not everyone can remember CP/M. There actually are people out there who haven't been around computers for the past 40 years.)

I've also added a man page to the Linux archive and a PDF version of the man page to the web site.

So, if you are interested in Panel for Windows command line or Linux, mosey on over to:

http://hfradio.org/wb8rcr

and click on "Panel (not QSLMaker)" to get to the Dial/Panel page. If you are a Windows user, and haven't used Panel before, please read the "Note for Windows users (PDF format 30K)".

Enjoy

Several others have suggested very good books, notably
those published by ARRL.

A couple other sources are the publications of the RSGB (in
English English...:-) www.rsgb.org and the Ham Radio
Bookstore listings at CQ Communications Inc.
http://ssl.sunserver.com/cq/index.ihtml

An "inbetweener" source is Harry's Homebrew Homepage at
http://w1.859.telia.com/~U85920178/

Harry Lythall (SM0VPO) is an electronics technology instructor in Sweden and writes very well. He does a lot of simpler project construction with everything well illustrated in clear European-style schematics and good photos (of most projects).

There are several other websites with such information and good explanations. As a personal preference, I rate the RSGB's publications as offering more detail, especially mechanical items, than the average ARRL described project...a decade or two ago when both publishers weren't skimping on pages printed. :-)

The only one who can divine what you want or need is you, Dwight. If you find a good technical library or large bookstore that sells radio related books, go there and browse, do some skimming through contents, illustrations, see what is familiar and not familiar to you. An ARRL floor rack at an HRO store is okay but there is a lot more available for learning about radio, amateur or otherwise.

Knowledge builds upon itself in any technology, but you MUST be familiar enough with the basics to go through all succeeding levels. You can "start in the middle" and go both ways but that takes much, much longer than a linear learning process...even longer without guidance from an instructor. If you encounter an area in radio technology that is unfamiliar to you or you don't understand it, break off temporarily and concentrate learning on that area...then continue with the main subject of your learning.

Everything in a "radio" is interrelated. A "radio" is a system and the system is made up a group of interconnected circuit blocks. Those blocks may have smaller blocks within them, each one having a specific purpose. The smallest blocks are the circuits themselves. You must recognize that blocks aren't separate entities standing alone; bigger blocks have basic relationships within the "radio" in order to work together (image response in a superheterodyne is one such and the amount of image rejection will dictate how and why certain smaller blocks are configured as well as their component values).

A "radio" isn't a multi-dimensional crossword-like puzzle that it may seem. Once you understand the system-block-miniblock-circuit structure and the necessity for certain block-to-block operation specifications, all the different dependencies will align themselves in your mind and you can concentrate detailed thinking anywhere you want.

There is NO "best" way to design-build-whatever any "radio." There are many different ways to do that. For hobby purposes the "best" choice is dictated by intended use, cost of parts, ability to construct, test equipment available, skill level of the builder or student. Anyone can be misled into what consitutes the "best" way to do something, especially when advertisements

for radios abound. Each advertiser is striving mightily to separate money from your wallet in exchange for their product. The latest and greatest advertised whiz-bang technofeature may be too much whistling and bell-ringing than you really need...and also may be just so much phlogiston specification-wise (like the gold-plated music system speaker wires for "maximum sound quality"...as if all can hear a thousandth of a db difference).

All the book publishers are into advertising their products, too. [they are pretty good wordsmiths] The difference between books and electronic equipment is that books can be readily opened and examined in detail...not possible with most electronic stuff. For that reason I recommend BROWSING what is available to see what you need. You are your best judgement source on what you know or don't know.

Be sure that whatever filters you use provide a high input
impedance at harmonics. This can be assured by using
a coil input filter and locating it close to the output
transistors. Avoid long runs of coax between the
amplifier and filter. Doing this will get you up to 50%
more output power. The explanation for this is complicated, and involves
doing a Fourier series
analysis. It turns out that the open circuited harmonic
impedance allows the voltage waveform to clip, which
increases power at the fundamental. This is probably
NOT obvious. Maybe Helge explained it somewhere
in his voluminous writings, but you may not have seen it.
Another non-obvious thing is that most 12V designs
depend on collector trace inductance for their operation,
so if you "improve" the board layout, they won't work.
I don't believe Helge ever documented this, if he even
knew it himself.

About two weeks ago, a co-worker brought a frequency counter to my office. Just for fun I turned it on and 155.700mhz displayed. Next day we tuned a scanner to that frequency...Feedback City. Five other offices have the same situation on slightly different frequencies.

We let the boss know, but he thinks we are watching too much X-files. The company I work for handles a lot of personal info. Peoples SS#, date of birth, ect.

I could call the police, but that might get me fired. I just thought if we could block the transmitters that might make it safer.

Could someone please give me a circuit that would jam these transmitters?

A couple of suggestions:

1. Get a set of closed-ear headphones for the scanner, or cheap earplug phones inside of 30 dB hearing protectors. Give another listen, and see if you are actually hearing speech or just tones.

2. Talk with the local ham radio club and see if they know any hams at the local TV station. See if you can borrow an engineer and a portable spectrum analyzer that will cover the frequencies in question. Bring the engineer and the analyzer in, and let him look at the signals. He will be able to tell you in a few seconds whether you have an audio bug, an audio/video bug, or just a noisy computer or LAN.

You don't want to try that. You will get the FCC very unhappy with you.

Would it be practical to design a broadband (say 1-30 MHz) amplifier
with negative feedback ? This would reduce the distortion when the
amplifier is _not_overdriven_. Since the gain would be set by passive
components, the maximum input signal could be well defined and limited
by a low level limiter and filter prior to the amplifier.

Getting adequate phase margins would be a challenge and may require
using UHF power transistors for adequate fT, which would make the
design quite costly. Is there other ways to get adequate phase margins
when the output transistor fT is only slightly above the required
frequency range ?

After all negative feedback is used in some receiver front end designs
to get a high IP3 value with a reasonable power consumption. Modified
audio amplifiers with a feedback loop are also used on the 135 kHz
band.

<< Feedback City. Five other
offices have the same situation on slightly different frequencies. >>

John-

You need to find the bug if there really is one. Perhaps the counter or the scanner has a signal-strength indicator to help you locate it.

The Boss can't argue with the evidence. But beware, you could still lose your job. What if your Boss is the one listening-in on his employees? Bearing that in mind, don't be surprised if the signals have disappeared since alerting your boss!

Fred

The first step is not to jump to conclusions.

The second step is to use headphones with your scanner to prevent feedback. If you still get what sounds like feedback, it's probably not a bug at all, but likely just some computer noise. OTOH, if you hear office noises from the scanner then your best course of action is to contact the FCC immediately.

However, if you want to pinpoint the source yourself, you can use the squelch knob on your scanner to locate the source of these signals. Turn up the squelch until the signal just cuts out, then walk around the office until it kicks in again. Repeat this several times and eventually you will be able to narrow down a small area. Then remove the antenna and you should be able to pinpoint the source. It will probably be leakage from a cheap computer case.

But assuming your scanner indicates that you have a bug: As someone else stated, they may have been put there by the boss. They may also have been put there by a business competitor. What I find strange is the frequency -- commercially available bugs don't usually use VHF Public Safety Pool freqs, they are almost always in the FM broadcast band or high in the UHF spectrum, and the Feds use stuff in the tens of Gigahertz. So there is a possibility that the bugs (if they exist) were planted by local law enforcement. Another possibility is that they are the tools of a techno-stalker. So before you embark on a bug-hunt, first consider all the possibilities and their consequences.

BTW, jamming is not an option because of the possibility that the bugs are legal, in which case you could get popped by the FCC for causing harmful interference, and maybe even for obstruction of justice. Not only that, but you will be building a jammer that screws with Safety Pool freqs (Fire, Police,

Ambulance, etc), which could endanger lives. Let the FCC handle it.

The FCC has no jurisdiction unless the transmitters are illegal
due to license requirements. That is very unlikely.

The FBI and the local police who enforce State laws have
jurisdiction, but one needs to be *very* sure of what is going
on first. Second, you need to realize that while a monitoring
device may be illegal, it is also true that the police agencies
have murders to investigate too. Your place on their priority
list might be a bit lower than ensuring the men's washroom is
properly cleaned by the janitorial crew.

>However, if you want to pinpoint the source yourself, you can use the squelch

Stop and think about how to locate the device first. If it is
in fact a monitor, you do *NOT* want to give away the fact that
it has been located. That is true even if you have already
spilled the beans loudly that you know it exists.

Find it. Then *watch* it. If somebody tries to remove it,
bingo, you then know who put it there.

>But assuming your scanner indicates that you have a bug: As someone else stated,
>they may have been put there by the boss. They may also have been put there by a

And consider whose feet you are stomping on by going public with
it. Almost regardless of who put it there, finding it is going to
raise some kind of a stink. You want to be well prepared legally,
and politically, before the shit hits the fan.

The most important advice is SHUT UP. Stop talking loudly and stop
posting to Usenet!

If going to the boss didn't get even a raised eyebrow for a
response, he is almost certainly either too dumb to talk, or was
well aware that it existed and knows who put it there and why.
In other words, the OP is already probably in hot water.

>BTW, jamming is not an option because of the possibility that the bugs are
>legal, in which case you could get popped by the FCC for causing harmful
>interference, and maybe even for obstruction of justice. Not only that, but you

That is off the scale of concerns. Jamming can be done very
legally. For example, playing a loud radio in the room with it
sitting right next to the bug is "jamming", and legal. As far
as RF, you'd need to know where the _receiving_ end is, so trying
to use RF jamming isn't likely to effective.

>will be building a jammer that screws with Safety Pool freqs (Fire, Police,
>Ambulance, etc), which could endanger lives. Let the FCC handle it.

There are effective ways to handle it, and the FCC isn't likely
to be any part of it (unless it is in an FCC office!).

But just what the effective ways are depends totally on just where
this bug is, who put it there, and who is being monitored... none
of which have been disclose and none of which the OP should be even
whispering about in any place like Usenet.

(I've had the most unusual experience of actually finding a
wiretap in the work place, calling the FBI, talking to lawyers
about it, and surviving the politics that resulted. The result
was one technician immediately transfered to an engineering slot
to protect him from union backlash, one supervisor fired seven
months later, one manager fired one year later, and one VP let
loose two years later.)

Well, Most of the ham-type shops will be at the hamvention.

Surplus Electronics:

My favorite is Midwest Surplus Electronics on Main St in Fairborn, OH --
just outside Wright Patterson AFB.

Also, Mendelsohn is downtown on 2nd St (?).

And, you will be just down the road (approx 70 miles) from Fair Radio in
Lima, OH..

What did I miss?

Theoretically it is possible. Practicality is another matter.

Negative feedback requires the fed back phase to be within
something like within 160 to 200 degrees, depending on the
feedback network loss and amplifier gain magnitude...AND
the open-loop amplifier phase shift between feedback network
input and the point of feeding back the RF in the amplifier.

A full decade bandwidth amplifier (more likely 2 to 30 MHz
rather than 1 to 30 MHz) usually experiences more phase
shift over that bandwidth than can be realized by just looking
at it and/or its schematic. You MUST measure it fairly
accurately to understand it...an area where the (unfortunately)
very expensive Vector Voltmeters can excell.

The "passive" feedback network will also have a phase shift
variation across that decade bandwidth that may be beyond
the allowable phase margin. It MUST be tailored in phase as
well as magnitude to fit with the measured magnitude-phase
characteristics of the amplifier.

Operational amplifiers are deliberately designed and built to exhibit a limited amount of phase shift that is fairly well about 90 degrees close to their open-loop unity-(magnitude)-gain frequency. That's done even when they use high-f-sub-t transistor junctions and have open-loop gain magnitudes reaching all the way to 500 MHz. Op-amps are very broad-band, all their internal reactances are tightly controlled and reproducible. That allows all op-amp users to tailor closed-loop frequency responses by their external feedback networks.

Even with "broadband" design using solid-state devices, the actual open-loop phase shift characteristics in the linear operating region can exhibit a fairly wide phase shift input to output. Those "broadband" transformers are good for level magnitude response but phase shift can vary. Often there are simple input-output passive networks to match transistor impedances over that decade bandwidth...the combination causing variation of phase over bandwidth of that stage. That phase shift won't affect their linearity or introduce any distortion and probably doesn't affect harmonic content due to slight deviation from linear response.

I'm not saying that broadband negative feedback is impossible, just that it can be rather difficult to achieve in reality. I've seen it done with octave bandwidth amplifiers after considerable work of measurement, calculation, trials, and some replacement of amplifier transistors that went into oscillation. :-)

The usual method of feedback-to-improve-linearity is envelope detection with the detected RF magnitude used to control gain. That greatly reduces phase shift problems but does not yield a true negative feedback situation. Envelope detection works only on the magnitude component of gain.

>Getting adequate phase margins would be a challenge and may require
>using UHF power transistors for adequate fT, which would make the
>design quite costly. Is there other ways to get adequate phase margins
>when the output transistor fT is only slightly above the required
>frequency range ?

It's not a truism that the active devices have a very high f-sub-t. What really counts is the overall amplifier phase shift which can be adjusted internally to fit within a 0 to 90 degree margin going up in frequency. That's why I mention the op-amp devices and circuits. Their phase shifts are published and it is relatively easy to derive an equivalent electronic analogue of their internals so that a full circuit with feedback can be analyzed.

To apply negative feedback requires thinking in both open-loop (no feedback) and closed-loop (with feedback) conditions.

In a simple push-pull RF linear, there's an input transformer and an output transformer and the variation of impedance of the

single pair of RF transistors well below their f-sub-t limit. Add in simple networks for (some) input matching and the open-loop phase shift can vary quite a bit over the total bandwidth. That's not always reproducible after given just the transformer and transistor and component information...the whole amplifier must be measured for both gain magnitude and phase across its band AND beyond band limits.

>After all negative feedback is used in some receiver front end designs
>to get a high IP3 value with a reasonable power consumption. Modified
>audio amplifiers with a feedback loop are also used on the 135 kHz
>band.

Comparing narrow-band examples with broadband things is a bit like comparing pineapples and kumquats. They are both edible but the similarity stops there. :-)

In narrowband circuits a single resonant circuit will set the phase shift positively to a -90 to 0 to +90 degree change going across the desired frequency from well below to well above it. The magnitude of maximum power transfer is very related to phase shift so the overall open-loop response is predictable for applying negative (phase) feedback. Way below to way above resonance have reproducible 90 degree shifts.

Narrowband circuits using filters with many stages ("poles, zeroes" of response) are going to play all sorts of nasty games with you if feedback is applied around the filter. A filter can have MANY full-circle phase shifts across its designed bandwidth. Negative feedback around such circuits with filters having multiple phase rotations within their bandwidth will be next to impossible.

There are definite limits of feedback application in narrowband systems (such as 135 KHz), usually dictated by the specific circuits.

Broadband linear amplifiers would be a different case in design and application. Open-loop response can be measured in both magnitude and phase, but few amateurs have the equipment to do so at RF. A feedback network of passive devices can be designed and checked analytically without fancy test equipment. If open-loop frequency response is known and feedback network response is know, analysis can fairly accurately predict the closed-loop amplifier response.

The FCC has sole jurisdiction to determine if the devices are legal.

>jurisdiction,

It is their jurisdiction to determine that the devices, if legal, are being used
legally. The FCC is the agency to contact because they will contact any other
agency that may be using the devices and confirm their legal use, and do so
without interfering with any investigation that may be happening.

The original post raised some suspicions. Like, who brings a freq counter to work? Was it show-and-tell day at the office? And why 155.700? And why a jammer and not get the bugs removed? And posting through Google with a Yahoo email addy? Really, it sounds like someone is either trolling or wants to jam police freqs for less-than-honorable purposes. But I'll give him the benefit of the doubt, for now.

Not on PSP freqs. That's a guaranteed method to land you in some really hot water, not just with the FCC but with local law enforcement as well.

Don't count on it. The FCC responds very quickly to RFI on PSP freqs. They also
respond quickly to any possible illegal electronic surveillance.

>But just what the effective ways are depends totally on just where

Does anyone in this group know the RCA remote protocol ? Or a URL I can
go to for such information ???...

I have several RCA remotes Direct TV... VCR Audio System...
all the remotes operate all the other devices (SORT OF)

Thanks

Ted in Atlanta KD4EE

I generally pick up an old radio from a thrift store; they go for a
song. Take out what you need and chuck the rest away.

Lessee...counters aren't particularly sensitive, so the signal is
strong. You can find it easily with a little field strength meter,
I'd guess, 'specially if you have one with a tuneable preselector.
But if "Feedback City" means you get an audio squeal that goes away
just like squeal in a PA system as you turn down the volume, then just
monitor it for a while using headphones or at very low volume and see
whose voices come through the loudest...they will be the ones closest
to it. Shouldn't take you long at all to figure out where it is (they
are).

Doesn't seem like the right freqs, but do you folks use cordless
headsets? (Bad idea if you're handling sensitive info, by the way.)

Cheers,
Tom

Now this reminds me of a story involving police radar. Seems one day
they gave a speeding ticket to someone who worked for the FCC. After
the police asked to see his driver's license, he asked to see THEIR license
to operate a RADAR TRANSMITTER (the police department didn't have
one). The ticket got thrown out of court (in fact EVERY speeding ticket
issued that month got thrown out of court!).
I forget the name of the city involved. (Though Miami FL did have a problem
with police radar about 20 years ago. Seems they tracked some houses going
over the speed limit!).

>A perfect example of the FBI's incompentence.

You are going off the deep end with fantasy on every part of
this. The above has *nothing* to do with the FBI's competence
or lack thereof. Nothing above suggests that it does, though
the facts that clearly prove that it doesn't were not part of
the above description. The FBI did a marvelous job! That was
true simply because even though there was never any clear
indication that Federal law had been broken, the FBI made an
effort to investigate it well enough to be positive. In fact,
no Federal law was broken! But the FBI's presence kept the
company sitting still long enough for other factors to keep them
from going off half cocked (which they definitely would have if
the FBI had backed out in 10 minutes instead of 2 days).

I was referring to grounded base "noiseless feedback" amplifiers with
emitter and collector feedback windings on the same core e.g. "A High
Dynamic-Range MF/HF Receiver Front End" QST February 1993 p.73.

The audio power amplifiers I was referring to were Mosfet audio power
amplifiers from Maplin or BT with nominal audio power in the 300 W
range delivering over 100 W in the European 73 and 135 kHz bands. None
of the suggested changes would make these amplifier narrow-band
amplifiers.

While both the receiver front end and the audio power amplifier
operate with a limited set of frequencies, the amplifiers are them
selves broadband, since no bandpass frequency selective network is
within the feedback loop.

Is Peter Tankard any relation to Paul Tankard? I'm currentkly working with him at HBOS!

Best bet apart from raiding old radios (actually, don't hold up much hope there...most little transistors seem to use short rods or ferrite bars. The only old transistor sets I've seen with the long bars have been almost collectors pieces...:-)

Keep an eye on places like Bull Electrical in Brighton or there's a place in Handsworth, Sheffield, whose name escapes me. And in Sheffield might be worth giving Bardwells a ring.

Joe

You can glue them together, this works quite effectively.

Greeting
I used to subscribe to Hambrew and sadly they are now gone....so are most
of my back issues. I am looking for an article in one of them that
featured a DSB rig built for 80m by a fellow I believe was from the
Netherlands. If anyone has that issue, I wonder if I could get a
copy of the article? Replies can be direct.
Thanks es 72-

Nothing yet has suggested that the device was not put there by
police...

>and if someone is building and/or selling "bugs" that are strong enough to ring
>up a freq counter then they are probably exceeding Part 15 specs. That ain't

If, if, if... But there is no indication that it isn't legal.

>legal. It could also be a serious problem should they interfere with police
>communication. Like, what if someone was using bugs like these in a building

If it is interfering with police communications, don't you think
the police would have called in the FCC, or a technical
consultant, to determine what the cause is?

>>>It is their jurisdiction to determine that the devices, if legal, are being used
>>>legally. The FCC is the agency to contact because they will contact any other
>>>agency that may be using the devices and confirm their legal use, and do so
>>>without interfering with any investigation that may be happening.
>>
>>Why would the FCC contact another agency regarding the use of a
>>legal (or illegal for that matter) device?
>
>Hmmm... maybe to "confirm their legal use, and do so without interfering with
>any investigation that may be happening"?

If the FCC determined that the device was legal, they have no
reason at all to call in another agency. If they determine the
device is illegal, they have whatever authority is needed.

>>But nobody said a word about jamming PSP freqs. You are imagining
>>things here that are not necessarily the scenario that would be
>>effected.
>

>155.700 is indeed a PSP freq.

And nobody has suggested jamming 155.700. Mostly because that
would be relatively useless and there are better ways.

>>>> For example, playing a loud radio in the room with it

'Nuf said.

>>>Don't count on it. The FCC responds very quickly to RFI on PSP freqs. They also
>>>respond quickly to any possible illegal electronic surveillance.
>>
>>I don't agree with your opinion.
>
>It is your right to disagree. However, I was speaking from experience. Maybe the

Maybe you happen to live next door to the only active FCC Field
Office in the entire US. I've been in the business for nearly
half a century, and I've seen exactly two field reps that were
not inside an FCC office.

Getting an FCC field rep to even answer a telephone in Alaska
would be damned difficult, much less finding one that would
travel anywhere to look at a suspected "bug" in someone's office!

>field agents in my area are more gung-ho than in your district, but I have
>personally witnessed several cases of interference with the PSP, and two cases
>of suspected illegal electronic surveillance. The FCC responded quickly in every
>case (and quite harshly with the moron that was deadkeying on the police freqs).

On the other hand, I've seen interference on PSP frequencies go
on for *weeks* with no response from the FCC.

>You found a wiretap and the FBI decided that there was no law being violated? If
>the wiretap was legal, why were three people eventually fired? If it wasn't

You need to pay very close attention to what is and what is not
stated, and stop assuming that you imagination is correct.

I said no Federal law was violated. That is true.

An Alaska State Statute was violated. But, as I also mention,
the Alaska State Troopers have murders to investigate. I'd also
point out that AST has engaged in a number of illegal wiretaps
themselves, and has yet to *ever* investigate anyone for illegal
wiretaps! That includes the Fairbanks newspaper that tape
recorded a cell phone conversation (which also just happened to
have an illegal AST wiretap on it too!) and then printed the
conversation verbatim on the front page! It was hilarious, but
there was no prosecution for illegal wiretaps, to be sure. (The
party of interest, however, is in jail forever. He was
convicted of murder, which he confessed to in the tapped
telephone conversation. No evidence of either wiretap was put
before the court though!)

Whatever, the FBI found they had no jurisdiction in the wiretap mentioned previously. The State Troopers would not have been interested either, and were not notified (to my knowledge). However, there is little doubt that what happened was not according to Company Policy, was not appropriate in a number of ways, and that the company could not continue to use management people who did not understand that well enough to have avoided the problem to start with.

I'll give you a very broad hint of the type of problems this incurs. Lets say Company A does business with Company B, and Company B has a representative visiting Company A during a period of time when Company A is tape recording their telephone lines. That means they will be monitoring the business transactions of Company B when the visiting representative makes calls either to his home officer or to other companies that he deals with, including competitors to Company A.

Now, replace the name Company B with the name of the 2nd largest manufacturer of telecommunications equipment in the world, and guess what kind of a telephone call they would make if their security people heard about a wiretap that may or may not have recorded their business transactions? They did make that call.

>legal, why didn't the FBI do anything? And why did you need to talk to lawyers?

Because I am not a lawyer. I can read the Statutes about as well as anyone, but I'm not dumb enough to think that is sufficient to understand how the law is going to affect such a situation. I spent all of $50 for an attorney to look it up and explain it to me. It was worth every penny, because I then knew *exactly* which buttons *not* to push. If you think that VP didn't talk to his General Counsel, or that he didn't catch on very quickly to the fact that I was only pushing the right buttons, you'd be wrong. In fact, when made did make a statement to the employees, it was well dotted with references to lawyers and potential law suits by employees, none of which he named.

>Did the company threaten you for discovering a wiretap? Was it their wiretap?

Why do you think the whole chain of command from a line supervisor to a VP ended up changing jobs? Do you really think none of them wanted to see me to the door? ;-)

Heh heh, why do you think they resorted to a wiretap in the first place! ;-)

>Not only that, but the original post was asking about wireless bugs, which falls
>under the jurisdiction of the FCC. What does wiretapping have anything to do
>with wireless bugs? Your story lacks consistency and relevance.

You seem to lack the ability to focus on what is relevant.

Wireless bugs and wiretaps are not precisely the same, but your
civil rights are the same in both cases. And that, not Federal
law, is the significance of finding a bug in your office.

The original poster wanted to obtain equipment to jam that frequency. I suspect the "bug" story was false. He just wants to jam that frequency for whatever reason and the bug story was a fabrication to make us think his reason was legitimate.

Crooks are so often dumb. That's why the jails are full of 'em.

3314. FS: Old Radio-Related Books, 1930's - 1980's

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-06 17:53:40 UTC
From: oldbooks78@aol.com
Message-ID: <20030506135340.04869.00001040@mb-m05.aol.com>
Source record: 35617

I currently have the following old radio-related books for sale. Postage is $2.50 for the first book, and $1 for each additional item (Media Mail within the US, at cost elsewhere). The books are:

Jordan, Edward C.; Paul H. Neilson; William Carl Osterbrock; Fred H. Pumphrey, Lynne C. Smeby "Fundamentals of Radio" Prentice-Hall, 1945. Twelth printing. The 400 page hardbound book is in very good condition, clean with no page tears or pen marks. A nice early text on radio design and principles of operation, including a few fold-out schematics. Price: US$ 10.00

Everitt, William Littell "Communication Engineering" McGraw-Hill, 1937. The 727 page hardbound book is in about very good condition. Clean with no page tears or pen marks except for a previous owners name and address inside the front cover, and a few passages underlined in pencil. A nice early text on the science of the radio. Price: US$ 9.00

Frost, J..M. (Editor) "World Radio TV Handbook, The Authorative Directory of International Radio and Television (Volume 39, 1985)" Billboard Publications, 1985. The 600 page softbound book is in very good condition, clean with no page tears or pen marks except for a previous owners name and date at the top of the Table of Contents. Price: US$ 4.00

Measurements Development Laboratory of the Sperry Gyroscope Company "Microwave Transmission Design Data" Sperry Gyroscope Company, 1944. Publication No. 23-80. The 215 page hardbound book is in very good condition, clean with no page tears or pen marks, and a strong binding. Originally issued during WWII as a "confidential" document. Chapter topics include General formulae for concentric lines; Attenuation in concentric lines; Reflections and impedance matching; General formulae for wave guides; Attenuation in wave guides; Reflections and impedance matching in wave guides; Wave guide tees and bends; Wave guides filled with dielectric material; Dielectric material: Cavity resonators; and Measurement techniques. A neat early book on ultra-high frequency radio waves. Price: US$ 7.00

Worldwide Publications "White's Radio Log, Vol. I, Number I" Worldwide Publications, c1982. The 136 page softbound book is in good+ condition, clean with no page tears or pen marks. Not dated, but looks to be from the early 1980's. A directory of North American AM, FM, and TV stations including world-wide shortwave stations. Price: US$ 3.00

American Radio Relay League "The A.R.R.L. Antenna Book" American Radio Relay League, 1960. Nineth edition. The 320+ page softbound book is in good condition. The covers show some wear from previous use, there are a few bent page tips, and there is a previous owners address label inside the front cover. A good solid reading copy of this informative text on radio antenna technology. Price: US$ 5.00

Federal Telephone and Radio Corporation "Reference Data for Radio Engineers" Federal Telephone and Radio Corporation, 1950. Third edition. The 640+ page hardbound book is in very good condition, clean with no page tears or pen marks, and a strong binding. A nice early edition of this classic radio reference data text. Price: US$ 9.00

Beam, Robert (editor) "A Dictionary of Electronic Terms" Allied Radio, 1959. Soft Cover. The softbound 80 page book is in very good condition, clean except for a previous owners name marked out inside the front cover. Concise definitions of words used in radio, television and electronics. Price: US$ 2.00

Institute of Radio Engineers "Proceedings of The Institute of Radio Engineers, October 1933" Institute of Radio Engineers, 1933. Volume 21, Issue Number 10. The approximately 200 page softbound book is in good+ condition, clean with no page tears or pen marks. Some moisture discoloration to the spine area paper, but not too bad, and not affecting the inside pages. Includes a foldout-out figure of oscillogram readings. Price: US$ 8.00

Institute of Radio Engineers "Proceedings of The Institute of Radio Engineers, December 1937" Institute of Radio Engineers, 1937. Volume 25, Issue Number 12. The approximately 200 page softbound book is in good+ condition, clean with no page tears or pen marks. Some minor wear to the spine paper, but not bad at all. Page tips in rear lower corner bent outwards somewhat. Price: US$ 8.00

Institute of Radio Engineers "1933 Report of the Standards Committee of The Institute of Radio Engineers" Institute of Radio Engineers, 1933. The 225 page softbound book is in good+ condition, clean with no page tears or pen marks except for a previous owners name on the front cover. Some wear to the spine paper, but not too bad. Page tips in rear lower corner bent outwards somewhat. A neat look at standards development for the radio in the early 1930's. Price: US$ 8.00

US War Department "Technical Manual - Radio Fundamentals, TM 11-455" U.S. GPO, 1941. The 140 page softbound book is in fine condition, fresh and clean inside and out except for a previous owners name on the front cover. A nice WWII vintage radio manual. Price: US$ 10.00

Or, all of the above for $75 post paid. If interested in any of the above, please email to "Oldbooks78@aol.com" to reserve. Thanks.

Dave

>shifting.

I didn't specify any values. Those values may or may not vary
so the only way to know is to measure the component by
itself, the driving and driven stages, and how they are when
all connected.

A schematic diagram alone doesn't help on that.

>>>After all negative feedback is used in some receiver front end designs

>
>I was referring to grounded base "noiseless feedback" amplifiers with
>emitter and collector feedback windings on the same core e.g. "A High
>Dynamic-Range MF/HF Receiver Front End" QST February 1993 p.73.

A grounded-base, grounded-gate, or grounded-grid isn't exactly
a "negative feedback" amplifier. That will have some phase
shift variation over a decade of frequency.

I was using the generic amplifier form throughout. There can be
so-called "exceptions to a given rule" but the "exception" here
is probably not any true exception (I haven't seen that so I can't
comment with any accuracy on it).

The Conditional: If this "noiseless feedback grounded-base" amplifier works when reproduced with all stated components (no substitutions), then the designer has either compensated for phase shifts in the basic no-feedback circuit with opposite phase shifts in "transformer feedback windings" or simply lucked out.

RF transformers (and many AF transformers) ARE going to exhibit variation in phase shift over their normal operating frequency range. How much or how little will depend on configuration, core material, winding number, and a bunch of other smaller factors. In general, RF transformers of the toroidal or "binocular" type (beads in a line, windings threaded through center hole, in pairs) should generally have little phase shift, probably not more than 10 degrees or so (not an absolute only a rule of thumb from experience).

Problem is, a generic two-stage amplifier, push-pull each, will no doubt have three broadband transformers. The open-loop phase shift, input to output, is going to be the sum of all the individual phase shifts. Applying negative feedback around all of them, means the feedback network MUST compensate for all the open-loop shifts. If it doesn't, one can wind up with a power oscillator that has positive feedback, not negative. Failure to compensate for quadrature-value shifts (near 90 degrees) in open-loop response can result in NO feedback effect when the loop is closed!

Go back to the op-amp situation for the "no effect" condition, look at data sheets which show various amounts of feedback percentage versus frequency response. Where the open-loop gain approaches unity...and where the internal phase shift gets close to quadrature... the closed-loop gain is almost the same as open-loop. The cause is BOTH magnitude and phase shift of open-loop values with an essentially resistive feedback network (very little phase shift by itself) for closed-loop response.

There's no sure, a priori way to determine that a particular coupling in an amplifier is exactly 0 or 180 degrees in phase shift. Usually it is close to either value. How much variation there really is has to be measured. But, there can be a trap waiting to close on you if you start substituting parts such as high f-sub-t transistors in place of those specified in an article and then apply negative feedback by some means. A gain of greater than unity with a feedback phase near 0 degrees will result in an oscillator...and the oscillation may very well be at a frequency higher than you can observe with home equipment. Those higher frequency f-sub-t transistors can boogie on out to a wider bandwidth than most workshop instruments can sense.

Chances are, you WILL observe something if the fed back amp pops into oscillation even if you can't detect the RF directly. That will probably be seen as way too much distortion. That can trick one into assumptions such as the bias is set wrong...which may not be the case at all.

I was trying to point out that negative feedback applied in any RF amplifier is open to a lot more variables to mess it up than an audio range "high-fidelity" amplifer. Resistors in the AF and near-AF range are going to look pretty much like resistors. Those same resistors can have series inductance and parallel capacitance at higher RF. They aren't ideal components at those frequencies.

>The audio power amplifiers I was referring to were Mosfet audio power
>amplifiers from Maplin or BT with nominal audio power in the 300 W
>range delivering over 100 W in the European 73 and 135 kHz bands. None
>of the suggested changes would make these amplifier narrow-band
>amplifiers.

If these amplifiers are ALREADY wideband AND of good linearity, why consider them for added negative feedback?

>While both the receiver front end and the audio power amplifier
>operate with a limited set of frequencies, the amplifiers are them
>selves broadband, since no bandpass frequency selective network is
>within the feedback loop.

Okay, so you've not got any selective thingies in them. Many existing low-level RF amplifiers DO have such things. I was stating general cases. One begins with general cases to start understanding them, then it can narrow to specific cases.

The very same cautions on feedback apply to positive feedback, the ones where an oscillator is the end result. Get too much phase variation over the tuning range and the output power varies with frequency...or it may show more instability at one tuning end versus the other...as two examples only.

Look at a simple regenerative detector, around almost as long as vacuum tubes have existed. There's almost always a regeneration control in them. That's because the positive feedback phase shift AND magnitude isn't flat across its tuning range. Again, an example to point out something, not a specific in all situations.

At RF you can't just "apply feedback" without knowing and thinking more about open-loop response than at AF. That's true whether the feedback is supposed to be negative or supposed to be positive. RF has lots more variables in a circuit that schematics don't show directly. Those variables get larger with increasing frequency.

After working with a lot of different circuits at RF, both successes and failures, one can develop lots of "rules of thumb" that are good beginnings for any design or modification. Just the same, the real world still requires knowing the open-loop response FIRST. At RF that requires knowing both magnitude and phase values.

Solid state or tubes ?

For tubes look at some of the older (say before 1966) ARRL handbooks from
ebay.

Well a transceiver would have been rare for AM. Transceivers didn't
really become common on HF until SSB came along (thought for VHF it
was a different matter). The only commercial rig that comes to mind
was the Gonset.

Homebrew, it would have been, with few exceptions, separate transmitters
and receivers. I can picture a few mobile units, where a converter
was packaged in the same box as an AM transmitter. And maybe a few
times when a transmitter and receiver were packaged together for
mobile or portable operation. However, these weren't the transceivers
of today, and the only shared circuitry would have been the power supply,
and maybe the audio section.

I don't think I've EVER seen an Ancient Modulation transceiver circuit for 80m. I've seen a few DSB circuits: here's one http://www.qrp.pops.net/willy.htm.

Seriously, in this day and age, DSB transceivers are trivial, almost simpler than AM, and SSB transceivers only require the addition of a crystal filter to kill one sideband. Or see the Phillips (sp?) NE602 app note on Weaver (phasing) SSB generation.

That's my conclusion as well. His NNTP host (24.206.97.209) comes back to the
Birmingham news server for Earthlink. Since that server covers nearly the whole
state, I just went to the FCC search page and input 155.700 + AL, and presto, up
pops about half a dozen law enforcement agencies licensed for base/mobile on
that freq. The sad thing is that he probably got the info he asked for anyway
from some paranoid, anti-government jello-head that read the post.

What the OP wanted, and what we've been discussing, are two
distinctly separate things.

I addressed email to the OP regarding his post, with very little
advice and a couple of rather pertinent questions and the
comment that nothing further would be coming without
verification of the answers.

He did not respond, and I take that to mean that my original
suspicions (and yours too) were correct.

However, you and the OP are not a dichotomy. You can both be
wrong.

I do know what you mean about using that equipment, but I am not promoting a Spectrum Analyzer design on my website.....only the noise source. The noise source can be built for around 25 dollars. I have compared the flatness of response to my NoiseCom NC6112, and up to about 1.5GHz, the results are very similar.

>What the OP wanted, and what we've been discussing, are two
>distinctly separate things.

The OP asked for help to build a device that will jam radio transmissions on a
specific frequency. That much should be obvious by now. However, the discussion
became about what to do if you find that you are bugged with wireless devices.
First, there is the question of legality. From the CFR Title 47:

Sec. 2.701 Prohibition against use of a radio device for eavesdropping.
(a) No person shall use, either directly or indirectly, a device
required to be licensed by section 301 of the Communications Act of
1934, as amended, for the purpose of overhearing or recording the
private conversations of others unless such use is authorized by all of
the parties engaging in the conversation.
(b) Paragraph (a) of this section shall not apply to operations of
any law enforcement officers conducted under lawful authority.

Sec. 15.9 Prohibition against eavesdropping.
Except for the operations of law enforcement officers conducted
under lawful authority, no person shall use, either directly or
indirectly, a device operated pursuant to the provisions of this part
for the purpose of overhearing or recording the private conversations of
others unless such use is authorized by all of the parties engaging in
the conversation.

Now, assuming someone finds a radio device being used for eavesdropping. The FCC
is the first agency to contact because it is their responsibility to determine
if the above regulations are not being violated. Notice that there are two parts
to these regulations: First, the device must be an authorized radio device,
which is clearly the sole jurisdiction of the FCC. Second, they may only be used
by "law enforcement officers conducted under lawful authority". That phrase, or
anything like it, doesn't appear in any other federal regulation, and therefore

the sole jurisdiction AGAIN rests with the FCC. So even if the devices ARE legal, it is up to the FCC to see that they are being used "under lawful authority". That means they must contact any and all law enforcement agencies within that jurisdiction and determine if the devices are being used legally.

So in your own words, "'Nuf said."

But apparently not, because then you interjected with wiretapping, which is not the same as wireless bugs simply because a wiretap doesn't necessarily involve radio. The FCC doesn't have jurisdiction over wiretapping UNLESS it involves wireless communication. If the wiretaps do not use radio devices then the jurisdiction falls onto the state, not the FBI. Now the FBI becomes involved when the wiretapping (and wireless eavesdropping, for that matter) are used in the commission of an interstate (federal) crime....

IOW, you have to know what crime is being violated before you can determine jurisdiction, and therefore contact the appropriate agency. Evidently, you don't know the difference.

So can you, Floyd. Don't forget that.

Glad this thread hasn't devolved into a shouting war....

When I first read the thread, I couldn't rmember the name of a book to
recommend. Now, I have it before me...

ARRL's latest, "Experimental Methods in RF Design" by Wes Hayward,
W7ZOI, Rick Campbell, KK7B and Bob Larkin, W7PUA may be what this
fellow wants.

The book is a replacement for the earlier Hayward book some have
mentioned already. It take the reader who has a basic working
knowledge of electronics to a more advanced level. There are practical
examples of all sorts of circuits and concepts. In fact, the book has
a full description of the design and building of a 2 meter SSB
trasceiver. It's not a "step-by-step' instruction manual but rather a
book which uses project to illustrate design concepts.

I think it's what the original poster is looking for. The price is a
little steep at $49.95 (with a CD-ROM full of docs and software) but
looks to be worth it. Get it at www.arrl.com.

The Staedtler Lumocolor 318 works very well, and comes with a fine point.

Dear Rich,

I seem to remember something like that in my shed somewhere. Probably a little different - AFAICR they have oval bases with two holes for mounting screws. Please contact me via this e-mail address with a real address I can e-mail to and I'll give you more details. I am a little loath to part with them.

>
>The OP asked for help to build a device that will jam radio transmissions on a
>specific frequency. That much should be obvious by now. However, the discussion
>became about what to do if you find that you are bugged with wireless devices.

Hence, as I said, what the OP wanted is not what we are
discussing, and is not germane.

>First, there is the question of legality. From the CFR Title 47:

What, exactly, are the criminal penalties for violation of a CFR?

Aren't we just a little more interested in the Communications Act of
1934 as ammended, and a few others from the US Code?

Here is where you can find what makes the description given by
the OP a potentially criminal case. (Note that it has virtually
nothing to do with the FCC or licensed operation of radio
equipment.) Note that this one law makes both a wiretap illegal
and makes equally illegal the use of a radio device (licensed
or otherwise) to intercept "oral" communications.

"&#65533; 2511. Interception and disclosure of wire, oral, or electronic communications prohibited

(1) Except as otherwise specifically provided in this chapter any person who--

(a) intentionally intercepts, endeavors to intercept, or procures any other person to intercept or endeavor to intercept, any wire, oral, or electronic communication;

(b) intentionally uses, endeavors to use, or procures any other person to use or endeavor to use any electronic, mechanical, or other device to intercept any oral communication when--

(i) such device is affixed to, or otherwise transmits a signal through, a wire, cable, or other like connection used in wire communication; or

(ii) such device transmits communications by radio, or interferes with the transmission of such communication; or

..."

Perhaps you should revue then entire law in detail.

http://www4.law.cornell.edu/uscode/18/2510.html

>Sec. 2.701 Prohibition against use of a radio device for eavesdropping.
> (a) No person shall use, either directly or indirectly, a device
>required to be licensed by section 301 of the Communications Act of
>1934, as amended, for the purpose of overhearing or recording the
>private conversations of others unless such use is authorized by all of
>the parties engaging in the conversation.
> (b) Paragraph (a) of this section shall not apply to operations of
>any law enforcement officers conducted under lawful authority.
>
>Sec. 15.9 Prohibition against eavesdropping.
> Except for the operations of law enforcement officers conducted
>under lawful authority, no person shall use, either directly or
>indirectly, a device operated pursuant to the provisions of this part
>for the purpose of overhearing or recording the private conversations of
>others unless such use is authorized by all of the parties engaging in
>the conversation.

So if you and I violate the above, the FCC can yank our tickets!
Whoop dee doo!

>Now, assuming someone finds a radio device being used for eavesdropping. The FCC
>is the first agency to contact because it is their responsibility to determine
>if the above regulations are not being violated. Notice that there are two parts

The FCC has _regulatory_ jurisdiction. The FBI however has
jurisdiction when a _criminal_ violation of Federal law has
occurred. If you want assistance with ensuring compliance with
the regulations, calling the FCC to have an unlicensed operator
censured and forced to comply with Federal regulations is very
much in order.

But if you want the same party charged with criminal use of that
equipment, call the FBI.

In fact, both may be involved, but the most significant
difference is that the FCC has relatively very few field
personal and they are engineers not law enforcement, while the
FBI has many and they have authority conduct criminal
investigations.

Perhaps *you* happen to live close to the only seriously active
FCC office in the country, but 200,000,000+ Americans don't.
They should contact the local FBI or other law enforcement
agencies if they want any chance at all for some kind of action.

>to these regulations: First, the device must be an authorized radio device,
>which is clearly the sole jurisdiction of the FCC. Second, they may only be used

It is the sole jurisdiction of the FCC to administrate the
authorization of said radio device. It is not the sole
jurisdiction of the FCC to deal with criminal operation of said
device.

Which do you want, a criminal investigation or a letter to the
perpetrator demanding that the device be properly licensed and
operated?

>by "law enforcement officers conducted under lawful authority". That phrase, or
>anything like it, doesn't appear in any other federal regulation, and therefore
>the sole jurisdiction AGAIN rests with the FCC. So even if the devices ARE

Your logic is a bit confused. How does that phrase give "sole"
jurisdiction to the FCC??? In fact, it does not. In fact even
you said that what the FCC would do is call in a police agency.
They will in fact call in the agency that does have jurisdiction.

And it has *nothing* to do with whether the device is license or
not.

>legal, it is up to the FCC to see that they are being used "under lawful
>authority". That means they must contact any and all law enforcement agencies
>within that jurisdiction and determine if the devices are being used legally.
>
>So in your own words, "'Nuf said."

Any police agency has exactly the same requirement. And of
course police agencies might even have people available to
investigate. How many criminal investigators does the FCC
employ full time?

>But apparently not, because then you interjected with wiretapping, which is not
>the same as wireless bugs simply because a wiretap doesn't necessarily involve
>radio. The FCC doesn't have jurisdiction over wiretapping UNLESS it involves
>wireless communication. If the wiretaps do not use radio devices then the
>jurisdiction falls onto the state, not the FBI. Now the FBI becomes involved
>when the wiretapping (and wireless eavesdropping, for that matter) are used in
>the commission of an interstate (federal) crime....

And just as obviously when the wiretap does involve radio
devices... the FCC is just as involved (and equally
unavailable).

Regardless, you did notice that CFR 47 is titled
"Telecommunications", not "Wireless Telecommunications", right?
They have exactly the same jurisdiction over non-wireless
telephone systems as they do over wireless telephone systems.

>IOW, you have to know what crime is being violated before you can determine
>jurisdiction, and therefore contact the appropriate agency. Evidently, you don't
>know the difference.

The FBI is going to have jurisdiction if there is a violation of
Federal law.

>>I addressed email to the OP regarding his post, with very little
>>advice and a couple of rather pertinent questions and the
>>comment that nothing further would be coming without
>>verification of the answers.
>>
>>He did not respond, and I take that to mean that my original
>>suspicions (and yours too) were correct.
>>
>>However, you and the OP are not a dichotomy. You can both be
>>wrong.
>
>So can you, Floyd. Don't forget that.

You were claiming that the OP being wrong makes you right. I've
not made any such claim.

3341. New KDSP2 Advanced DSP Filter for the K2

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-07 19:58:45 UTC
From: Eric Swartz WA6HHQ - Elecraft <eric@elecraft.com>
Message-ID: <3EB96575.2010202@elecraft.com>
Source record: 35643
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

We've just released the KDSP2 advanced DSP for the K2. Below is the KDSP2 product description.

(We have also just released three transverters (6M, 2M and 220 MHz) that work with most HF rigs and an external band decoder box for controlling antenna switches and band pass filter boxes. Instead of putting everything in one huge email I'll be posting them separately to the list.)

73, Eric WA6HHQ
http://www.elecraft.com
============

The Elecraft KDSP2 brings versatile, high-performance digital signal processing (DSP) technology to the K2 and K2/100 transceivers. The KDSP2 unit, which is fully integrated with the K2, plugs directly into the Control board. It's also very easy to assemble, with no surface mount components to install. The DSP IC and related parts are pre-installed on a small plug-in module.

The KDSP2 provides up to four user-configurable filters in each mode (CW/SSB/data), complementing the K2's variable-bandwidth crystal filter. CW filter settings include center frequency and bandwidth, with "hard" and "soft" filter algorithms and bandwidths as narrow as 50 Hz. SSB filters provide programmable low and high cutoff frequencies. Four levels of noise reduction are available in CW and SSB modes, while SSB mode includes an automatic notch filter. The KDSP2 is unique in that noise reduction and auto notch parameters can be modified to suit the operator.

Filter modes and features can be quickly accessed via the K2's DISPLAY button, while parameters adjustment is accomplished using the DSP module's own menu system. In addition, the unit's firmware is flash-based and field upgradeable. The DSP code is open-source to encourage community involvement and education.

Like our KAF2 analog audio filter module, the KDSP2 includes a real time clock/calendar with its own backup battery. This feature is especially useful during field operation, eliminating the need for a separate clock for logging or contest use. Current drain of the KDSP2 can be reduced to approximately 10 mA by placing the audio filter subsystem in bypass mode.

The DSP code for the KDSP2 is open source, allowing advanced users to create their own DSP features for the K2. User supplied alternate DSP code will be posted in a special KDSP2 download page on the Elecraft web page. (DSP source code and K2 interface link module will be placed on this web site by 6/30/03.)

The KDSP2 is priced at $219. Additional information, pictures and orders can be placed via our web page at http://www.elecraft.com . KDSP2 units will be introduced and limited quantities will be available at the Dayton Hamvention,

May 16 ï¿½ 18th (Booth 196-7). Orders placed via our web page will begin shipping within two weeks following Dayton.

3342. New XV Transverters for the K2 and most HF rigs

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-07 19:59:17 UTC
From: Eric Swartz WA6HHQ - Elecraft <eric@elecraft.com>
Message-ID: <3EB96595.4040608@elecraft.com>
Source record: 35645
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Here is the transverter information. More pictures at http://www.elecraft.com

73, Eric WA6HHQ

Three state-of-the-art transverters are included in Elecraft's new XV Series: the XV50 (6 Meters), XV144 (2 Meters), and XV222 (222 MHz). The transverters can be used with nearly any transceiver that covers the 28 to 30 MHz frequency range, including Elecraft's high-performance K2 and K2/100.

The XV Series provides important benefits for the operator in both receive and transmit modes. On receive, the transverters combine a low receive noise figure (typically 0.8 dB) with a high dynamic range front end (+17 dBm mixer), ensuring exceptional weak-signal performance even in large-signal environments. Reliable overload detection is included at the IF port to protect the mixer. On transmit, the XV's 20-25 watts output will drive most high power linear amplifiers. A sequenced keying output is provided for external amplifiers, and a built-in wattmeter using a 10-segment LED bargraph provides fast power output monitoring. Provision is also made for an optional crystal oven to enhance frequency stability.

Single-port and dual-port IF connections allow use with almost any transceiver. IF transmit levels from 0 dBm to +39 dBm (1 milliWatt to 8 watts) can be accommodated, with a constant-impedance IF termination for consistent performance. Multiple transverters can be easily daisy chained to a single IF transceiver, providing multiband operation without cable rearrangement. A brightly illuminated label clearly identifies which transverter is selected.

The XV Series transverters are packaged in attractive, low-profile enclosures measuring only 1.2" (3 cm) tall, with styling that matches the Elecraft K2. The transverters are also well integrated with the K2 electrically, providing automatic band selection; independent, calibrated display of each transverter's operating frequency to 10 Hz; and front-panel power level control.

Like Elecraft's transceivers, the XV transverters are completely modular, simplifying construction and alignment. The professionally-written, fully illustrated manual will appeal to experienced as well as first-time builders. The kits are easy to assemble, featuring "no-wires" construction, and all surface-mount parts used in the kit (15 total) are pre-installed at the factory.

Price: $349.00
Availability:

Orders received now will begin shipping June 22nd. Additional information and on line ordering can be found at http://www.elecraft.com

3343. KRC2 Band Decoder For the K2 and most HF Rigs

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-07 19:59:36 UTC
From: Eric Swartz WA6HHQ - Elecraft <eric@elecraft.com>
Message-ID: <3EB965A8.6090203@elecraft.com>
Source record: 35644
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Here is the information on the KRC2 band decoder.
73, Eric WA6HHQ

The Elecraft KRC2 Band Decoder is a universal, programmable station control unit that can switch any combination of antennas, filters, amplifiers, or other equipment. It supports analog, digital, and RS232 control inputs, so it's compatible with transceivers from Icom (voltage level), Yaesu (BCD), and Kenwood (serial or BCD via logging program), as well as Elecraft's own K2 and K2/100.

The KRC2 includes decoded outputs for all HF bands (including WARC bands), three transverter bands, and general accessories. High-side (source) and low-side (sink) relay drivers are included. All signal lines are RF bypassed to eliminate RFI and noise pickup.

Individual driver outputs can be "wire-ORed" as with conventional decoders. However, the KRC2 also provides a PC-based command interface, allowing the user to configure the unit with simple text commands. New firmware can even be downloaded via the internet. The combination of these features makes the KRC2 uniquely suited to the user's present as well as future station control needs.

The KRC2 is fully integrated with Elecraft's transceivers, decoding band-change data via the company's AuxBus protocol. But other unique K2 features are also supported that can be enabled or disabled with jumpers inside the KRC2. The K2's ACC menu entry can be used to directly control the KRC2's accessory outputs. Four buttons on the top of the KRC2 can be used as "hot keys" for instant access to CW message buffers, fast switching of the rig's RXANT jack, or other functions. Finally, the KRC2 can act as a complete CW-feedback interface for the K2, allowing enhanced accessibility for operators with special user interface requirements.

Packaged in an attractive, compact enclosure that is only 1.2 x 3.5 x 5.5 inches (3 x 9 x 14 cm), the KRC2 is styled to match the K2. The easy-to-build kit uses Elecraft's "no-wires" construction and is suitable for first-time kit builders.

Price: $159.00

Availability:

Orders received now via phone or via the Elecraft web site, http://www.elecraft.com , will ship the week of June 22nd.

A while back, I had listed some capacitors for sale. Some oil - some dry. When I placed the first ad, unbeknownst to me, some of my stock was misplaced. I couldn't find all of my caps. I found them. Mostly electrolytic type. These are good for home brew power supply filtering. They are about 2 - maybe 5 or more inches in diameter. Some are a tad smaller than the others.

If you want a list of all the caps I have available, e-mail me direct for it. They are varying in price depending on size. Shipping will be extra and payment via Money Orders only. ALL sales final.. NO RETURNS.

Have many other items available as well Have a list, but it is added to almost daily. So if you're in need of anything - please ask. I may have it. I'm clearing out my inventory as I am looking to move.

In addition to those, a friend handed me an ancient book titled "Giant Book of Radio Projects." At least that is what he said the title was (the cover and many pages are missing). Anyway, it does have a VHF SSB receiver and transmitter project in it. The only problem would be finding modern replacements for the ancient components listed. Other than that, the project seems rather straightforward.

I think DSB transceivers are significantly easier to build than SSB
transceivers. I recently built two DSB transcievers and one SSB transmitter.
See http://planeta.clix.pt/n2cqr for info on these projects.

I think the DSB rigs provide a great way for a builder of moderate experience
to get the thrill of going on the air with a completely HB rig.
It may be considered trivial, but VERY few hams have actually done it.

I have also used Staedler Lumocolor 318 Permanent Marker with very good
results once the surface is clean with no oxide, grease etc. I have tried
also other types of markers and overhead projector pens, but none of
these comes even close to the Staedler performance in this very
application. I suppose they all are just fine in their intended use, but
the PCB etchant (I use hydrochloric acid + hydrogen peroxide) is
a most hostile environment and I have long ago stopped experimentation
with other
brands.

Hello.
I have an old AM transmitter with valve.
I want to build an RF Choke for the plate of the tube, because the
transmitter's choke was destroyed. I can't find it on any store.
The ols is an air RF Choke (without core) winded on a tube of paper,
with values of 2,5 mH / 300 mA.

Does anyone knows how can i wind one myself?
Is there any calculator to find the nessecary turns for this RF Choke?

Thank you
Eniac.

P.S. i apologize for my pure English.

Yes, certainly you should be able to wind one yourself.

For 300mA, I would use a wire diameter about 0.2mm, but even smaller may be OK. Even 0.1mA copper wire should not melt with 1 amp of DC current, but beware of RF current heating. The problem will be the size of the coil, if you use wire that is too big, assuming you are trying to wind it as a single layer solenoid. If you have the old coil, use the same size wire as it used.

The inductance value should not be very critical. You should be able to use the simple inductance formula for a single-layer solenoid (since it sounds like that is what the original was). In English (American??) units, it's

L = (n*r)^2/(9*r+10*l)

where L is inductance in uH
r is coil radius in inches
l is coil length in inches
n = number of turns

If you use millimeters instead of inches, it is just

L = (1/25.4)* (n*r')^2/(9*r'+10*l')

where
r' is coil radius in millimeters
l' is coil length in millimeters
rest as above.

That makes for a pretty big coil, to get to 2.5 millihenries, assuming even 10 turns per millimeter. How big was the original, and was it wound as a single layer, or in "pi" sections? See picture at http://www.wilcocorp.com/catalog/wound_coils/pdf/MP.pdf if you don't know what "pi wound" means.

Cheers,
Tom

The rotor is an: Alliance Model 225

It uses 5 wires. One puts the control box pointer where he wants the beam, and the rotor goes there. There is no meter showing antenna position, just a red lite showing the rotor is "in transit" to a new location of the antenna. (the rotor and the antenna are un-aligned). When they again get back aligned, the red lite extinguishes.

Wiring diagram needed !

Please respond to jhilins@wi.rr.com

2N3866 I think will run about a watt. Try running two of them in push-pull.

2SC1909 is a CB final that will run 4 watts AM on 11, so it should do 2-3 on 20. They're a little hard to find, and the various CB dealers on the net typically want outrageous prices for them.

2SC1307 is an SSB CB final. You occasionally see batches of them on eBay.

Well, if you've used them before, you should've found a better chip by now, however, it's coupling back thru the PSU. From the Vdd connection, place a 33 uF cap (or larger) to ground. Then a 10 ohm resistor to Vdd, and another 33 uF to ground right at the chip and resistor. ie, not back at the power supply.

I've always had to bypass the output directly to ground with a good
quality 0.1 uF ceramic capacitor. The data sheet always specifies a
resistor in series with the bypass, but just about every one I've used
has oscillated unless bypassed directly. The direct bypass has never
caused any sort of harm or malfunction.

Thank you Tom.

I don't have the old one but i remember that it was "pi" sections.
For this type of wind, is it enough to divide the total turns to segments ?

Example :
total turns = 600
Segments = 3
turns by segment = 200 ?

Is this OK ?

Thank you.

The most simple fix is to use a 6 or 8v three terminal regulator to feed
the AF amp. This is a bit of overkill, but it does a very good job of
decoupling the amp and as worked for me in the past.

The alternative is 200 - 470 uf of bypass cap. on the chip supply
voltage.

John R. Strohm wrote:

> 2SC1307 is an SSB CB final. You occasionally see batches of them on eBay.

The 2SC1307 and 2SC1969 were used in a lot of SSB CB rigs.
Most of them used the 2SC2166 or 2SC1306 as the driver.

A few other numbers that come to mind: 2SC2312, 2SC1945
2SC1237.

Most PA transistors have the heat-sink tab connected to
the collector. IIRC, the 2SC1945 has the tab connected to
the emitter. This means you can usually bolt the transistor
directly to chassis/gnd without any insulation.

Agreed, and an addition: say someone else designs the vhf radio, and the design has no flaws. Never mind designing it, just plain BUILDING it can be difficult when you're new. Construction practices that won't hurt at HF can ruin a VHF/UHF circuit.

Another suggestion: go to hamfests and look for an old 2 meter
mobile rig that needs repair. If it has the schematic and block
diagram, buy it. You'll be able to learn a lot just repairing
it. Perhaps even better - buy an old crystal controlled
scanner at a hamfest. I've seen them go for $5.00. They cover
portions of VHF and UHF, and at that price you could afford
to "put bugs" on the receiver (i.e. purposely break it) and then
learn what that does to the performance, how to diagnose
the problem, and what the individual circuit does.

Thanks all for the advice, I got the d#mn thing to actually amplify, and it really is mediocre. Whoever suggested I find a differant amp is 100% right, which op amps in the .5-2watt(high gain +20dB) range are best, or should I use transistors to make my own?

I just built up a little LM380 amp which is similar. It was
motorboating, and like Dan said, some microfarads on the supply line
tamed it right down.
I'm going to use it on a Drake R4C which uses an archaic form of audio
amp that generates huge amounts of heat.

I'd really go for the Toshiba TA-7205. It's in some older handbooks. For a couple bucks, you get 55 dB of stable gain, the ability to shape the feedback for frequency response, and as much as 6 watts out with 12 volts. Try Jameco, MPJones and some of the others. In a pinch, send me a self addressed stamped envelope.

> Does anyone have any suggestions about a good(inexpensive) final that
> will give me about 2-3 watts DSB on 20 meters?

Alex: I'm very pleased to hear that there will soon be another
station
running QRP DSB on 20. I'm now running 1 W DSB HB solar powered on
that band.

I found that getting the final amp to run with stability was the
hardest
of the project. Here's an excerpt from an article I'm working on:

"I thought that once I had an SSB signal at 18 Mhz, RF
amplification would be the easiest part of the project.
I was wrong. As occurred with my Double Sideband rig, I had real
difficulty getting the RF amplifiers to
function with stability. As I was struggling, I came across a
comforting article by C.F. Rockey, W9SCH, in
the British QRP magazine SPRAT. OM Rockey noted that, "It is the
development of clean RF power in
appreciable quantities that is the greatest challenge in this field
for the average amateur." Amen to that,
Rock! W9CSH went on to suggest ways to surmount the difficulties,
but conceded that success is not
guaranteed: He mentioned the possible need to sacrifice chickens to
Papa Legba.
I didn't have to kill any chickens, but a 20 meter CW transmitter
was sacrificed. After several frustrating
attempts to get RF amplifiers working, I resorted to the maneuver
that I used in the Double Sideband
project: I pulled a working broadband 5 watt amplifier out of a
transmitter that I'd built several years ago
and modified it for linear service."

The circuit I ended up using can be seen in the 17 meter DSB portion
of my web site: http://planeta.clix.pt/n2cqr
It is a modification of the broadband amp used in the VXO 6 watter in
QRP
Classics.

Good luck. 73 Bill CU2JL N2CQR

> Is this OK ?
>
> Thank you.

The exact value of the choke should be non-critical. The formula I gave is for single-layer solenoid coils, but it will give a reasonable estimate even for multiple layers like you'll have in the sections. I would say the number of turns you suggest is reasonable, if your former is about 12mm diameter and the overall span of the segments is around 25mm. Try winding up one and see what inductance you get. It may take a little practice to get the pi winding right. If you don't have a ready way to make an inductance measurement, try resonating the choke with a capacitor and find the resonant frequency, and calculate the inductance from that. It may take a couple trials to get it right, but that's part of what homebrewing is about. Good luck with your project.

Cheers,
Tom

You may find this handy -
http://www.qsl.net/vk3bez/DL6WU-3.zip
Extract the spreadsheet and have a play.
Any band. Any size. 50ohm feed. Proven design.
Whatever materials you have at hand.

The DL6WU designs are excellent, but 10 elements is the minimum size.

A great Forum related to building transmitters and other stuff
Hello everyone.

Now a great forum related more or less building transmitters.

Guess could be very usefull. so take a visit and tell me about it. Should there be an other topic aswell??, would you like to be a moderator of a topic? Tell us and check it out.

http://www.alfalima.net/cgi-bin/teemz/teemz.cgi

Greetings and thanks

There is circuit for one in the 'surplus conversion manuals' published
by CQ
magazine. I would scan it and post it if I could find my copy. After I
finally
get my old magazines unboxed (still in storage after we moved) I could
do it.
Maybe someone else has this book.

There's a place for free military technical manual downloads:

www.kg7bz.com (run by August Johnson, KG7BZ)

There are two Technical Order documents for the ART-13 available
there:

TO 12R2-2ART-13-1 (21 MB file size)

TO 12R2-2ART-13-2 (42 MB file size)

Lots of other TMs available there for ancient glow-in-the-dark
military radio equipment in PDF. The few I've downloaded are
EXCELLENT in quality. August deserves some recognition
for that fine service.

There was a detailed article about using pens for resist, in Ham Radio magazine. I'd place it in 1986, but it might be a bit later. He rated various pens, including a Lumocolor that some have mentioned.

Unless I'm mixing it with another article, he mentioned opening the pen up and adding some rubbing alcohol, to make the ink draw smoothly on the circuit board. I remember trying this, and it did seem to help.

Obviously, cleaning the board is important. I use to use steel wool. In more recent years, I took one of those sanding attachments for a drill (a piece of rubber, and a piece that goes in the chuck where you also attach the sandpaper with a screw) and used pieces of that plastic "steel wool" cut to the size and shape of the rubber piece. No bits of steel wool around afterwards, and it made it terribly easy to get a shiny surface on the board, before and after the etching.

For cleaning and polishing the foil surface, the ordinary B&D
"Scrub Buster" works well, is cordless and waterproof, comes
with at least two standard plastic "steel wool" pads that un-
mount easily for cleaning or changing. Most any kitchen sink
cleaner works fine with that. No "mods" required.

A "Scrub Buster" can also do finishing of bare aluminum to a
nice gloss. It operates at a relatively slow revolution rate so is
less likely to jump (accidentally) to a high speed and toss a
piece of work off a bench.

Both the "Scrub Buster" and "Dust Buster" operate from a
non-standard-size rechargeable battery (charger is standard
with either). That might be an area to investigate as a high-
energy content supply for radio uses...don't know if anyone
has tried that yet.

Getting a household appliance away from a spouse is quite
another matter and a different ingenuity is required for that. :-)

Greetings Again everyone

sorry to post this unrelated laser question just thought maybe one of you electron focused brainiac's (-; might be able to shed some light on this for me!

problem:

Working on a rather cool full wave electro-acoustic resonator and need to drive a rather large piezo stack with 600-800v at 5.6khz-23.7khz adjustable sine wave output...

current will be somwhere between 125ma-250ma depending on the quantity of wafers I end up with in the stack and it needs to be quite linear in output.

Any Idea's poping into your head at the moment?

No audio application amps will swing bigger than 110-125v in bridge mode typically and I can't for the life of me think of a transformer type that will be anywhere close to the step (8 or 9 to 1) I need and yet capable of efficient inductance at that freq.

most audio related big transformers work very poor above 15khz and really are quite useless at 18khz+

Do any of you know of a cascaded output section amplifier topology capable of swinging this kind of amplitude at freq?

Many thanks for anyone with ventured knowledge or just thoughts...

Curt

800 V, 250 mA is 200 W into about a 3.2 K load.

> Any Idea's poping into your head at the moment?

Horizontal output transistors. Here's one:

http://www.nteinc.com/specs/100to199/pdf/nte165.pdf

Vce(max) is 1500 V, Ic(cont)(max) is 8 A, Pd(max) is 150 W. I suspect that
if you built up a bridge of them, with suitable phase inverters to drive
things correctly, and suitable feedback control to keep things nicely
linear, you could have some serious fun.

3412. Significance of inductance in transformers

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-12 20:18:41 UTC
From: jason_hsu@my-deja.com
Message-ID: <f7d9a152.0305121218.61d0e5a9@posting.google.com>
Source record: 35465
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.antenna

Thanks to everyone who gave me great advice on the improved SWR/wattmeter I have been working on this semester for an independent study project in my graduate work. I put my device together, and it works. Though it doesn't quite have the performance I hoped for, it still runs rings around the MFJ cross-needle meters (high SWR and QRP capability as well as 100W capability). In case you are wondering, I am using FT82-43 toroids for the transformers with #30 wire for the primary (high voltage, low current) windings. I really pushed the limits on many things, such as the capability of LM324s, the capability of LM3914s, the current capacity of wire (>1A and #30 wire on an FT50-43 core do not mix), the space needed for the wires connecting 20-40 LEDs, and what happens when you accidentally connect a capacitor the wrong way (leaking fluid, noise, mess on the breadboard).

I am working on my report, and one thing that still puzzles me is the significance of the inductive reactance in transformers. The design I am using is based on the one at http://engphys.mcmaster.ca/~elmer101/rfpower/swrtheory.html

I have heard that the inductive reactance across a transformer winding should be at least 4 times the resistance that is connected across it. There is 100 ohms of resistance across the voltage transformer, so that should mean j400 ohms of resistance are required in the winding. According to the software programs of Reg Edwards (and the ARRL formulas), the secondary winding (the 1-turn side) of the voltage transformer would have only .45uH with one of the FT82-43 cores I am using. Most other SWR meter designs actually use SMALLER cores (FT50, even FT37), which have even less inductance per turn. The .45uH is only j5 ohms on 160m and j84 ohms on 10m, a far cry from j400 ohms.

Could someone please shed some light on what is going on? How much inductive reactance is REALLY needed, and what would have happened if I did not have enough? Why can't RF transformers use plastic or air cores? (They would be much cheaper.)

Have you looked at TV line output transformer cores or switching mode power supply transformer cores. Those ferrites should operate reasonably in your frequency range.

You could even try using some existing SMPS transformers intended for 230 V mains SMPS and run them in the opposite direction. Take two such transformers (in the 50-100 W range) and connect the low voltage sides in series and you should have at least 400 V. With 3 or 4 transformers with the high voltage sides in series, you should be in the 600-800 V range. Unfortunately I have no idea about the linearity of the ferrites used in these SMPS transformers, so you may have to apply some feedback.

Paul

Our Radio Club is attempting to clear out an inventory of NOS tubes.
These will be available at Dayton Hamvention. We will be in the
Flea Market spaces 734 and 735. We intend to be there all day Fri.
and Sat. The list of our inventory is attached.

For cleaning and polishing the foil surface, the ordinary B&D
"Scrub Buster" works well, is cordless and waterproof, comes
with at least two standard plastic "steel wool" pads that un-
mount easily for cleaning or changing. Most any kitchen sink
cleaner works fine with that. No "mods" required.

A "Scrub Buster" can also do finishing of bare aluminum to a
nice gloss. It operates at a relatively slow revolution rate so is
less likely to jump (accidentally) to a high speed and toss a
piece of work off a bench.

Both the "Scrub Buster" and "Dust Buster" operate from a
non-standard-size rechargeable battery (charger is standard
with either). That might be an area to investigate as a high-
energy content supply for radio uses...don't know if anyone
has tried that yet.

Getting a household appliance away from a spouse is quite
another matter and a different ingenuity is required for that. :-)

I find acetone to be the best stuff to use, both for cleaning the
scrubbed board prior to marking out, and to remove the marker pen
afterwards. It really gets all the crap off like nothing else.

3419. Circuit diagram for Marconi 6960 power meters inputs?

Newsgroup: rec.radio.amateur.homebrew

Hello.

I need to circuit diagrams for Marconi 6960 power meters input connectors?

Can somebody send to me more information for powermeter. I have marconi
6422 power head and marconi 6960 powermeter, which i want to connect together.

Thank's.

>discussing, and is not germane.

The source of the discussion was WIRELESS devices, which was -VERY- relevant.
You can't obfuscate that fact, so don't even try.

>>First, there is the question of legality. From the CFR Title 47:
>
>What, exactly, are the criminal penalties for violation of a CFR?

Don't you understand the concept of the punishment being commensurate with the crime?

>Aren't we just a little more interested in the Communications Act of

Is there something that you don't understand about law and punishment?

>Here is where you can find what makes the description given by
>the OP a potentially criminal case. (Note that it has virtually
>nothing to do with the FCC or licensed operation of radio
>equipment.)

Say WHAT? Are you saying that eavesdropping using radio equipment has nothing to do with radio equipment? And that the FCC has nothing to do with radio equipment? PLEASE don't tell me that you don't see the connection!!!!

> Note that this one law makes both a wiretap illegal
>*and* makes equally illegal the use of a radio device (licensed
>or otherwise) to intercept "oral" communications.

As I quoted, Parts 2 and 15 of CFR Title 47 cover licensed and unlicensed radio equipment, respectively. The two regulations cover both bases. Your quote merely defines exclusions that do not extend beyond the exclusions in the regulations I quoted. Regardless:

> "ï¿½ 2511.

Subsection of what? Which title? Which section? If you are going to quote the law, at least learn to quote properly. Oddly enough, the law you cite below (but fail to quote in completeness) supports my argument.

>Perhaps you should revue then entire law in detail.
>
> http://www4.law.cornell.edu/uscode/18/2510.html

Perhaps you should "revue then entire law in detail" yourself, Floyd. The law you cite defines the exclusions established in Parts 2 and 15 of Title 47, as previously quoted:

>>Sec. 2.701 Prohibition against use of a radio device for eavesdropping.
>> (a) No person shall use, either directly or indirectly, a device
>>required to be licensed by section 301 of the Communications Act of
>>1934, as amended, for the purpose of overhearing or recording the
>>private conversations of others unless such use is authorized by all of
>>the parties engaging in the conversation.
>> (b) Paragraph (a) of this section shall not apply to operations of
>>any law enforcement officers conducted under lawful authority.
>>
>>Sec. 15.9 Prohibition against eavesdropping.
>> Except for the operations of law enforcement officers conducted
>>under lawful authority, no person shall use, either directly or
>>indirectly, a device operated pursuant to the provisions of this part
>>for the purpose of overhearing or recording the private conversations of
>>others unless such use is authorized by all of the parties engaging in

>>the conversation.
>
>So if you and I violate the above, the FCC can yank our tickets!
>Whoop dee doo!

Only Part 97 of Title 47 is about amateur radio licenses, or "tickets". You should really study this material before you publically make an ass or yourself on the newsgroup. (BTW, you do know that all these posts are archived for posterity, don't you? Maybe you want to think about your next post before you spout off more ignorance and make fools of your progeny.)

>>Now, assuming someone finds a radio device being used for eavesdropping. The FCC
>>is the first agency to contact because it is their responsibility to determine
>>if the above regulations are not being violated. Notice that there are two parts
>
>The FCC has _regulatory_ jurisdiction. The FBI however has
>jurisdiction when a _criminal_ violation of Federal law has
>occurred. If you want assistance with ensuring compliance with
>the regulations, calling the FCC to have an unlicensed operator
>censured and forced to comply with Federal regulations is very
>much in order.

You are starting to sound like those paranoid whackos who think that 'regulations' are not 'laws'. In case you missed the first page, "CFR" stands for "Code of Federal Regulations" which is LAW (as proclaimed by Congress, established by presidential acceptance, and supported by judicial authority), the violation of which is a CRIME. Is there something you don't understand here? The FCC is as much a law enforcement agency as it is a "regulatory" agency -- it enforces federal 'regulations' -- duh! (Maybe the problem is that there was never a TV sitcom based on the FCC...?)

>But if you want the same party charged with criminal use of that
>equipment, call the FBI.

Do you actually think that the FBI is the only federal law enforcement agency? Get a clue: www.rainreport.com

>In fact, both may be involved, but the most significant
>difference is that the FCC has relatively very few field
>personal and they are engineers not law enforcement, while the
>FBI has many and they have authority conduct criminal
>investigations.

In -FACT-, the FCC has MANY people charged with enforcing FCC regulations. Check out www.fcc.gov

>Perhaps *you* happen to live close to the only seriously active
>FCC office in the country, but 200,000,000+ Americans don't.
>They should contact the local FBI or other law enforcement
>agencies if they want any chance at all for some kind of action.

In -ANY- state, even Alaska, the FCC will get involved -VERY- quickly if you can show that there has been a serious violation. Jamming an active PSP freq is a

serious violation. Period. Do you disagree? If you do, I invite you to jam your local PSP freqs and see just how long it takes for the FCC to shut you down (i.e, lock you up). I suspect that it won't take them much longer than a week, probably less. Care to make a wager?

>>to these regulations: First, the device must be an authorized radio device,
>>which is clearly the sole jurisdiction of the FCC. Second, they may only be used
>
>It is the sole jurisdiction of the FCC to administrate the
>authorization of said radio device. It is not the sole
>jurisdiction of the FCC to deal with criminal operation of said
>device.

You still can't seperate the two concepts: criminal OPERATION OF such devices, and criminal ACTIVITY USING such devices. Regardless, the FCC is the agency that has jurisdiction in BOTH instances, as previously noted.

>Which do you want, a criminal investigation or a letter to the
>perpetrator demanding that the device be properly licensed and
>operated?

If you can cite even ONE case where electronic surveillance has resulted in nothing more than an NAL, I will concede such a lame excuse. You can't, therefore I won't.

>>by "law enforcement officers conducted under lawful authority". That phrase, or
>>anything like it, doesn't appear in any other federal regulation, and therefore
>>the sole jurisdiction AGAIN rests with the FCC. So even if the devices ARE
>
>Your logic is a bit confused. How does that phrase give "sole"
>jurisdiction to the FCC???

Because the responsibility is not given to any other agency. The logic is by inclusive authority -- pretty basic stuff. Did you even study logic? If you didn't, don't even go there. If you did, should I draw you a Venn diagram?

> In fact, it does not. In fact even
>you said that what the FCC would do is call in a police agency.
>They will in fact call in the agency that does have jurisdiction.

They must verify the legal use of such devices by contacting any law enforcement agency that may have authorization to use such devices. Did I stutter?

>And it has *nothing* to do with whether the device is license or
>not.

OTC, it does. LE agencies are not allowed to use unauthorized devices.

>>legal, it is up to the FCC to see that they are being used "under lawful
>>authority". That means they must contact any and all law enforcement agencies
>>within that jurisdiction and determine if the devices are being used legally.
>>
>>So in your own words, "'Nuf said."
>

>Any police agency has exactly the same requirement. And of
>course police agencies might even have people available to
>investigate. How many criminal investigators does the FCC
>employ full time?

More than you might think (but not enough, IMO).

>>But apparently not, because then you interjected with wiretapping, which is not
>>the same as wireless bugs simply because a wiretap doesn't necessarily involve
>>radio. The FCC doesn't have jurisdiction over wiretapping UNLESS it involves
>>wireless communication. If the wiretaps do not use radio devices then the
>>jurisdiction falls onto the state, not the FBI. Now the FBI becomes involved
>>when the wiretapping (and wireless eavesdropping, for that matter) are used in
>>the commission of an interstate (federal) crime....
>
>And just as obviously when the wiretap does involve radio
>devices... the FCC is just as involved (and equally
>unavailable).

They don't have the time or resources to hunt down every little snap, crackle and pop in someone's cellphone, which is what would happen if they investigated every paranoid rant. Show them some -real- evidence and they will be all over it like white on rice -- I shit you not.

>Regardless, you did notice that CFR 47 is titled
>"Telecommunications", not "Wireless Telecommunications", right?
>They have exactly the same jurisdiction over non-wireless
>telephone systems as they do over wireless telephone systems.

If you are going to quote the law, first show at least a superficial attempt to understand it. And here's a good start: where in Title 47 does it say anything about eavesdropping on wired communications? When you find that part then maybe then you can try and prove your assumption that the FCC has "exactly the same jurisdiction over non-wireless telephone systems as they do over wireless telephone systems". Otherwise, you should make a sincere attempt to understand what the word "federal" means, and why your assumption is wrong.

>>IOW, you have to know what crime is being violated before you can determine
>>jurisdiction, and therefore contact the appropriate agency. Evidently, you don't
>>know the difference.
>
>The FBI is going to have jurisdiction if there is a violation of
>Federal law.

Oh, come on now. If you think that the FBI is the only federal law enforcement agency then you have been watching too much TV. Don't plead ignorance here: If you break a tax law, do you think that the IRS is going to take a backseat to the FBI? Do you really think the readers of this newsgroup are THAT stupid?

>>>I addressed email to the OP regarding his post, with very little
>>>advice and a couple of rather pertinent questions and the
>>>comment that nothing further would be coming without
>>>verification of the answers.

>>>
>>>He did not respond, and I take that to mean that my original
>>>suspicions (and yours too) were correct.
>>>
>>>However, you and the OP are not a dichotomy. You can both be
>>>wrong.
>>
>>So can you, Floyd. Don't forget that.
>
>You were claiming that the OP being wrong makes you right.

I said nothing of the sort, Floyd. Don't attribute statements to me that I did not make. OTC, read your own words in context: "You can both be wrong", implying that not only was -my- opinion wrong, but so was that of the OP, even though he NEVER EXPRESSED any opinion AT ALL -- he just asked a question. Me think thou doth protest too much....!

> I've
>not made any such claim.

Your implication was that we were both wrong, again totally ignoring the fact that the OP was only asking a question.

So are you so bored that you want to argue this even further?

Hi All;
I have for sale a 1943 Weston 774-5 US Army Signal Corps ANALYZER. It checks just about everything, tubes, ohms, HV, Caps, etc!
It has some sort of Tube adapters which plug into the top so you can check each pin status with the built-in metering? I've never seen this before.
I have replaced the line cord & it seems to check the older style tubes just fine. It uses two dry cell batteries inside for the VOM, Both are original Burgess :-), one is a "D" cell, the other is a 4.5V which you can easily replace with 3 type "D" cells. Plenty of room in the case for this!
May need some cleaning, adjustments, etc!
Price is $75 + UPS.

I have an SG-9500 for sale for $180 including shipping. It is in excellent working condition. I am the original owner. Pictures connected to a oscilloscope are available upon request.

josh

Wide Band Signal Generator with Frequency Counter
Frequency on 6 ranges 100KHz to 150MHz (450MHz on harmonics)
Frequency accuracy 1PPM ±1 count
RF Output approx. 100MV to 35MHz
Crystal Output 1-15MHz uses HC 6/U holder
Output Attenuator Hi-Lo Switch with fine adjuster
Modulation Internal 1KHz
External 50Hz to 20KHz
Audio Output 1KHz at 1V RMS
Power 120V or 220V 50 or 60Hz
SG-9500 Frequence Counter
Range 1Hz to 150MHz in 2 ranges
Resolution 1Hz to 10Hz
Gate Time .1 sec, 1 sec
Input Sensitivity Less than 50MV RMS
Input Impedence 1M ohm
Accuracy 1PPM ± 1 count
Operation Temp 0-40°C
Digital Display 5 digit .56 LED

Hi All;
I have for sale a Brand-New w/bag-o-screws, never used VARIAC by the GENERAL RADIO Corp., Model is W10.
You your own enclosure, rated at 0-120 vac @10 amps.
Made in the USA to last a lifetime.
It is NOT CHINESE JUNK!
Price is $100 + UPS!(B/O?)

Thanks.

One way or another I'll try to figure out how many watts it can handle.
Ought to be good for up to 100 watts I should think. I know it's 37
turns, 30uH.

3432. Re: Significance of inductance in transformers

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-13 17:53:11 UTC
From: Bob <balbert@cnmnetwork.com>
Message-ID: <PtycnYfvMPSvrFyjXTWcoQ@cnmnetwork.com>
Source record: 35485
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.antenna

Air core RF transformers are very practical and in general outperform those with solid cores. It's just that they are larger.

Inductance is necessary because the primary current includes both reactive (due to inductance and reflected reactance) and resistive (load real power) components. If inductance is too low, the primary current will rise to a point where it might cause a problem with the source.

With solid cores, there needs to be some primary current that can be used to magnetize the core. This current has no external function but must be provided by the source.

Transformer theory is not trivial, and can't be given in a few words.

Hi there,
I am doing thesis on reconfigurable antenna. This will be
hard to explain but i will try my best. I have to connect a post to
the ground plane of the antenna thru a capacitor and PIN diode like
this.

(post)0---PINdiode---||---GROUND.

Whenever i add PIN diode, its giving me loss however i am able to
switch. Kindly help me in as to which PIN diode to use. I am presently
using UPP1004 and i am working in the 3GHz range. I need your
expertise.

Thank you.

>
>We can either argue with logic or take cheap shots at each other, but we can't
>do both. It's your choice.

YOU are the one taking cheap shots, or at least trying to.
That is *your* choice and I have nothing to do with it.

And you still want to take a "cheap shots" in this article
at every point too, it's filled with them because you don't seem
to be able to marshal up enough facts to support your opinions.

>The source of the discussion was WIRELESS devices, which was -VERY- relevant.
>You can't obfuscate that fact, so don't even try.

You are continuously bringing it up, as if it is something
significant that necessarily makes the FCC into what it isn't
(an agency to investigate criminal activity) and to exclude
other agencies.

Whatever, lets get on with a lecture on law, the FCC, administrative
regulations, etc. etc. Regardless of you much you fume as this
begins, by the end I do expect to not hear another peep out of you
unless it is an apology.

>>>First, there is the question of legality. From the CFR Title 47:
>>
>>What, exactly, are the criminal penalties for violation of a CFR?
>
>Don't you understand the concept of the punishment being commensurate with the
>crime?

Another absurd cheap shot. Which is hilarious considering that
you *clearly* do not understand the relationship the FCC has
with the law, much less with other Federal agencies such as the
Department of Justice.

My point was that CFR's are exactly commensurate with the crime.
The level they rise to is administrative censure and fines.

That is what the FCC handles, not criminal investigations which
are precisely what the FBI does for the US Department of
Justice. The FCC does *not* prosecute criminal violations of
the Communications Act, but only handles administrative actions
for rules violations relating to CFR's.

Your statements that the FCC handles criminal complaints and
investigations is totally bogus.

>>Aren't we just a little more interested in the Communications Act of
>>1934 as ammended, and a few others from the US Code?
>
>Is there something that you don't understand about law and punishment?

Cheap shots seem to by your only avenue here, since you lack
facts.

In fact, US Code is what Congress passes and the President
signs. Regulations are the administrative rules to
implementation regulation that the law says must be done. There
can be *no* criminal violation of a CFR unless US Code says it
is a crime. The FCC *cannot* write something into a CFR which
makes criminal anything which is not criminal under US Code.

>>Here is where you can find what makes the description given by
>>the OP a potentially criminal case. (Note that it has virtually
>>nothing to do with the FCC or licensed operation of radio
>>equipment.)
>
>Say WHAT? Are you saying that eavesdropping using radio equipment has nothing to
>do with radio equipment?

The fact that it is a crime has nothing to do with whether the
equipment used is "radio equipment" or not, licensed or
otherwise. The law makes it perfectly clear that it is
electronic _eavesdropping_ that is illegal.

>And that the FCC has nothing to do with radio
>equipment? PLEASE don't tell me that you don't see the connection!!!!

The FCC does not do criminal investigation of electronic
eavesdropping, whether it involves radios or otherwise.

>> Note that this one law makes both a wiretap illegal
>>*and* makes equally illegal the use of a radio device (licensed
>>or otherwise) to intercept "oral" communications.
>
>As I quoted, Parts 2 and 15 of CFR Title 47 cover licensed and unlicensed radio
>equipment, respectively. The two regulations cover both bases. Your quote merely
>defines exclusions that do not extend beyond the exclusions in the regulations I
>quoted. Regardless:

The CFR's that you quoted do not, and cannot, make it a crime.
The US Code is what makes eavesdropping with electronic
equipment a crime.

>> "&#65533; 2511.

Look carefully at the above line and notice that it starts with
a quotation mark. That indicates I quoted it from a source
other than myself. And I correctly cited my source too.

>Subsection of what? Which title? Which section? If you are going to quote the
>law, at least learn to quote properly. Oddly enough, the law you cite below (but

Since I quoted that from another source you are saying that my
source did not correctly cite US Code, we can all have a good
laugh at your abject ignorance of how to cite or reference
quotes. The source of _my_ quote was properly cited (see the
URL below) and from that cite you can look at the original
material from which I quoted.

You are claiming that the Cornell School of Law web site doesn't
know how to cite US Code. How hilarious can you get!

>fail to quote in completeness) supports my argument.

It specifically denies your argument. Or, at least it does
if you understand what it says. We'll get to that later.

>>Perhaps you should revue then entire law in detail.
>>
>> http://www4.law.cornell.edu/uscode/18/2510.html

And there you are; a proper cite for what I quoted.

>Perhaps you should "revue then entire law in detail" yourself, Floyd. The law
>you cite defines the exclusions established in Parts 2 and 15 of Title 47, as
>previously quoted:

US Code does not define exclusions for CFR 47 (it defines
inclusions, because it states what the CFR's are required to
implement). Any such CFR exclusions must necessarily be part of
the CFR. CFR 47 is the administrative rules to implement
regulation of what is in US Code.

You have which establishes law backwards.

>>So if you and I violate the above, the FCC can yank our tickets!
>>Whoop dee doo!
>
>Only Part 97 of Title 47 is about amateur radio licenses, or "tickets". You

Do you think that an amateur license can be pulled only for
violations of Part 97? I've got news for you... an Amateur
Radio license, as well as any commercial licenses issued by the
FCC, can be pulled for violations of *any* FCC regulation. That
is what I meant above when I mentioned "administrative censure".

>should really study this material before you publically make an ass or yourself
>on the newsgroup. (BTW, you do know that all these posts are archived for
>posterity, don't you? Maybe you want to think about your next post before you
>spout off more ignorance and make fools of your progeny.)

Ah, now it is not only me you take cheap shots at, but my
children too. Are you talking, when you speak of fools, about
my progeny that calls me up now and then for technical advice?
She's a pretty technical gal herself, and doesn't suffer fools
like you very well at all. She's the one with a law degree; I
give her technical advice on communications and she gives me
technical advice on law. You should have a lawyer give you
some advice too.

>You are starting to sound like those paranoid whackos who think that
>'regulations' are not 'laws'. In case you missed the first page, "CFR" stands
>for "Code of Federal Regulations" which is LAW (as proclaimed by Congress,
>established by presidential acceptance, and supported by judicial authority),
>the violation of which is a CRIME. Is there something you don't understand here?

I don't understand how you can think CFR's are "LAW" proclaimed
by Congress (the aren't), I also don't know what "presidential
acceptance" is (CFRs are not presented to the President for
acceptance), or how "judicial authority" supports CFR 47, though
it does support court rules on evidence and procedure for
courts. You've spent your wad on big words, but it doesn't seem
that you know what they mean.

The LAW proclaimed by Congress is the US Code. CFR's are the
administrative rules formulated by the Commission, which reports
directly to Congress even though it is managed by Presidential
appointees, to implement the requirements of US Code. Nothing
in a CFR is "against the law" unless the regulation is backed by
US Code to make it a violation. The Commissioners cannot decide
on their own what is or is not criminal. They can only write
rules to administer the laws passed by Congress.

>The FCC is as much a law enforcement agency as it is a "regulatory" agency -- it
>enforces federal 'regulations' -- duh! (Maybe the problem is that there was
>never a TV sitcom based on the FCC...?)

It administers regulations. The regulations are intended to
enforce the law. (More cheap shots, eh? You might be able to
write TV sitcoms, but I'm more into technical writing myself.
Fiction doesn't appeal to me the way it does to you.)

>>But if you want the same party charged with criminal use of that
>>equipment, call the FBI.
>
>Do you actually think that the FBI is the only federal law enforcement agency?
>Get a clue: www.rainreport.com

I did not make any such statement, but you are clearly
indicating that you think when I say the FBI is the correct

agency means it is the only agency.

It is still true that if you want a person charged with criminal
eavesdropping under Federal law, your best bet (actually it is
your *only* good bet) is the FBI because quite frankly every
other agency is going to investigate only to the point where
they can determine there is probable cause, and at that point
they will turn it over to the FBI. As I've said repeatedly,
the FBI does the criminal investigations, not the FCC.

>>In fact, both may be involved, but the most significant
>>difference is that the FCC has relatively very few field
>>personal and they are engineers not law enforcement, while the
>>FBI has many and they have authority conduct criminal
>>investigations.
>
>In -FACT-, the FCC has MANY people charged with enforcing FCC regulations. Check
>out www.fcc.gov

How many investigate criminal conduct? Non-compliance with
FCC regulations does not define criminal conduct.

>>Perhaps *you* happen to live close to the only seriously active
>>FCC office in the country, but 200,000,000+ Americans don't.
>>They should contact the local FBI or other law enforcement
>>agencies if they want any chance at all for some kind of action.
>
>In -ANY- state, even Alaska, the FCC will get involved -VERY- quickly if you can

That is simply not true. There is no point in you spouting
ignorance about things you don't know diddly squat about.

>show that there has been a serious violation. Jamming an active PSP freq is a
>serious violation. Period. Do you disagree? If you do, I invite you to jam your

I've seen it go on for *weeks* with not even a hint of FCC
activity.

>local PSP freqs and see just how long it takes for the FCC to shut you down
>(i.e, lock you up). I suspect that it won't take them much longer than a week,
>probably less. Care to make a wager?

PSP freqs here could be jammed for *months* and not get a rise
out of the FCC!

Of course again, you are guessing and I am not. Your vivid
imagination cannot sit with the idea that the FCC isn't going to
send in a swat team.

You do realize that the FCC does not have technical staff in
Alaska? And that I am located 700 miles from the nearest FCC
person of any kind (and probably more than 2000 miles from the
nearest field rep!)?

Did you think they'd have a couple guys drive over for the
afternoon do check this out?

>>>to these regulations: First, the device must be an authorized radio device,
>>>which is clearly the sole jurisdiction of the FCC. Second, they may only be used
>>
>>It is the sole jurisdiction of the FCC to administrate the
>>authorization of said radio device. It is not the sole
>>jurisdiction of the FCC to deal with criminal operation of said
>>device.
>
>You still can't seperate the two concepts: criminal OPERATION OF such devices,
>and criminal ACTIVITY USING such devices. Regardless, the FCC is the agency that
>has jurisdiction in BOTH instances, as previously noted.

You can continue to say that, but is still is not true. The FCC
administers the regulations. The FBI has jurisdiction over
criminal investigations.

>>Which do you want, a criminal investigation or a letter to the
>>perpetrator demanding that the device be properly licensed and
>>operated?
>
>If you can cite even ONE case where electronic surveillance has resulted in
>nothing more than an NAL, I will concede such a lame excuse. You can't,
>therefore I won't.

I can multiple cite cases (I've mentioned two already) where it
didn't even get that! Your concession is noted for the record.
We could also cite the Linda Tripp case and there was another one
a while back where a Congress critter had a tape that was illegally
recorded. Look them up! The FCC didn't do *anything*. That is
simply because criminal investigations are the FBI's jurisdiction.

Now, can you cite a case where the FCC (as opposed to the FBI
for example) has either investigate or pressed criminal charges,
much less prosecuted?

>>>by "law enforcement officers conducted under lawful authority". That phrase, or
>>>anything like it, doesn't appear in any other federal regulation, and therefore
>>>the sole jurisdiction AGAIN rests with the FCC. So even if the devices ARE
>>
>>Your logic is a bit confused. How does that phrase give "sole"
>>jurisdiction to the FCC???
>
>Because the responsibility is not given to any other agency.

Except you are wrong; it is.

>The logic is by
>inclusive authority -- pretty basic stuff. Did you even study logic? If you
>didn't, don't even go there. If you did, should I draw you a Venn diagram?

Lets see your Venn diagram.

Your problem is that "inclusive authority" is not exclusive and
where your diagram is going to overlap will show exactly what
I've been describing. What you'll also find is that just as I've
said, criminal investigations are not what the FCC does.

>>And it has *nothing* to do with whether the device is license or
>>not.
>
>OTC, it does. LE agencies are not allowed to use unauthorized devices.

But that is not what will make any give instance of eavesdropping
legal or illegal. If an agency is legally allowed to eavesdrop and it
is found that the devices used were not properly licensed, that does
not make the eavesdropping illegal. Likewise it is obvious that
properly licensed devices is not what legalizes eavesdropping.

The FCC is concerned with the licensing, the FBI is that agency
concerned with criminal eavesdropping.

>>investigate. How many criminal investigators does the FCC
>>employ full time?
>
>More than you might think (but not enough, IMO).

Well just name one within 500 miles of me, for example. Or
lets loosen it up a bit. How about within 2000 miles of me?

>>And just as obviously when the wiretap does involve radio
>>devices... the FCC is just as involved (and equally
>>unavailable).
>
>They don't have the time or resources to hunt down every little snap, crackle
>and pop in someone's cellphone, which is what would happen if they investigated
>every paranoid rant. Show them some -real- evidence and they will be all over it
>like white on rice -- I shit you not.

Your imagination runs wild.

>>Regardless, you did notice that CFR 47 is titled
>>"Telecommunications", not "Wireless Telecommunications", right?
>>They have exactly the same jurisdiction over non-wireless
>>telephone systems as they do over wireless telephone systems.
>
>If you are going to quote the law, first show at least a superficial attempt to
>understand it. And here's a good start: where in Title 47 does it say anything
>about eavesdropping on wired communications? When you find that part then maybe
>then you can try and prove your assumption that the FCC has "exactly the same
>jurisdiction over non-wireless telephone systems as they do over wireless
>telephone systems". Otherwise, you should make a sincere attempt to understand
>what the word "federal" means, and why your assumption is wrong.

If CFR 47 says nothing about eavesdropping on wired communications,
then you say that proves they don't have jurisdiction over non-wireless
telephone systems as hey do over wireless telephone systems????

Maybe you'd best draw a diagram on that one too!

>>>IOW, you have to know what crime is being violated before you can determine
>>>jurisdiction, and therefore contact the appropriate agency. Evidently, you don't
>>>know the difference.
>>
>>The FBI is going to have jurisdiction if there is a violation of
>>Federal law.
>
>Oh, come on now. If you think that the FBI is the only federal law enforcement
>agency then you have been watching too much TV. Don't plead ignorance here: If
>you break a tax law, do you think that the IRS is going to take a backseat to
>the FBI? Do you really think the readers of this newsgroup are THAT stupid?

More cheap shots because you cannot logically argue with facts
that the FBI does not have jurisdiction. The facts are that the
FBI does have jurisdiction.

It makes no difference if there are 30, 40 or 4000 other police
agencies under the Federal umbrella, the point is that the IRS
does not have jurisdiction, nor does the INS, nor does the Coast
Guard, nor does the Border Patrol, nor do FDA meat inspectors,
or Fish and Wildlife officers or the Secret Service. Or the FCC.

The FBI does have that jurisdiction.

>>You were claiming that the OP being wrong makes you right.
>
>I said nothing of the sort, Floyd.

Bullshit.

>> I've
>>not made any such claim.
>
>Your implication was that we were both wrong, again totally ignoring the fact
>that the OP was only asking a question.

I didn't say anything about an opinion by the OP, I just said
that your claim of a dichotomy was wrong. You claimed he was
wrong and that made you right. I just said there is no such
logical connection, because you could *both* be wrong, hence
your argument that he was wrong was a non-sequitur.

>So are you so bored that you want to argue this even further?

Why is it you can't discuss something without a cheap shot in
every other paragraph at a minimum? That line begs the question
of why you are so bored that you make up all of this imaginary
crap and post it. You mentioned that Usenet is archived (though
how you come to think that would make a fool of your children
instead of you I'm not sure) and it is clear that the true
significance of that archive hasn't yet sunk in. Maybe you just
haven't been reading news long enough to have the enormity of

writing for posterity sink in yet!

Whatever, lets end this stupidity of you blabbering away arguing with me. There are better things and people for you to argue with.

For example, here is one thing you probably don't really want to argue about, even with me:

The FBI is the principal investigative arm of the United States Department of Justice.

And that leads to someone you don't really want to argue with at all when it comes to law and the FCC, a fellow named William E. Kennard.

"Section 705 of the Communications Act includes criminal penalties. Accordingly, and in light of its close relationship to the wiretapping and related provisions of the criminal code, and at the request of the Department of Justice (DOJ), it is the FCC's longstanding general practice to coordinate complaints regarding potential violations of section 705 with DOJ in order to make sure that our administrative actions do not interfere with any DOJ criminal investigation. This is in accordance with a Memorandum of Understanding (MOU) with DOJ (effective since 1953 and revised and re-executed in 1989). The MOU specifically states that DOJ assumes responsibility for conducting investigations into complaints of alleged criminal violations of Section 705, and the Commission is to provide technical assistance when specifically requested by DOJ."

William E. Kennard providing testimony to Congress on February 5th, 1997.

It seems your claim that the FCC investigates criminal complaints and calls in the FBI is exactly backwards. The FCC will *not* investigate until the DOJ (hence the FBI) has completed their investigation and or specifically requests assistance from the FCC (as in it never happens).

Oh, Mr. Kennard spoke to the Subcommittee on Telecommunications, Trade and Consumer Protection U.S. House of Representatives as the General Counsel for the Federal Communications Commission, hence we can stipulate that what he said is true in spite of your opinions to the contrary.

So lets not hear another round of your false claims and cheap shots.

Looking (for a friend of course) for a 50A1 "ballast tube" for a multi band tube receiver.

I see net dealers with them with some crazy prices.

If you have one you'd care to part with, I'd like to try and buy it at a reasonable price. Please drop me a reply using the Email address below (cut and paste), not the one that appears in the reply header.

I'd also be willing to trade you for some type of tube you might need/want. I plan on giving the 50A1 away to someone, so even a working used one would work.

I've also read about solid state replacements for the 50A1. If you can provide me a refernce article on the web, I'll just make him one. I hate to reinvent the wheel.

thanks much for reading this

cheers

skipp

skippNOSPAMPLEASE@pilot.ucdavis.edu

Take the NOSPAMPLEASE out to reply, thanks.

 since P = I^2 x R, #12 wire will handle 1250w in RTTY mode, and
probably 3x that in SSB mode.

have phun.

"What is going on" should be outlined in detail in electronics
texts at your university. That's the best place to realize what
really happens in a "transformer," including its inductance,
interaction between windings, power transfer and loss with
loads of various impedances. Winding resistance, per se, is
associated with power loss within the transformer.

"Reactance" is the equivalent inductive or capacitive component
at ONE frequency. You need to respecify your question as "how
much inductance you need," not reactance without giving any
frequency value. That inductance will be dictated by the desired
operating frequency range...but it is modifiable by many other
things.

What you "really need" in terms of inductance of any winding in
a transformer is related to everything I stated in the first para-
graph above. Using an equivalent model of a transformer is a
good start to better see the relationship of a transformer to its
driving circuit and to its load. Almost any textbook has those.

If you have insufficient inductance for your circuit, you will
probably have some power loss at lower frequencies if untuned
(not resonated at a desired frequency). Many, if not most,
broadband RF transformers have extremely little inductance if
measured open-circuit (without any other connections to driving
circuit or load). An example of low-inductance broadband
transformers with little inductance is the 4:1 impedance matching
transformer for TV adapting a 75 Ohm to 300 Ohm characteristic
characteristic and working over the entire VHF and UHF portion
of the EM spectrum.

There are many, many examples of "air core transformers" in
older amateur radio texts. These are almost exclusively a high
impedance source (power amplifier, 2K to 10K in source
impedance) to a low impedance load (50 to 600 Ohms resistive).
They are also almost all resonated at the primary or high
impedance winding at a single frequency by a capacitor.
Another example is the older 455 KHz Intermediate Amplifier

transformer ("IF can") with both primary and secondary windings resonated at 455 KHz with trimmer capacitors mounted in the shield can. Cheaper AM BC radios used air cores. Slightly more expensive AM BC radios had powdered-iron cores to improve the coefficient of coupling to do two things: The structure could be slightly smaller (less inductance required in windings due to increased inductance effect of the iron core); the relatively narrow passband could be shaped to a more even amplitude response through control of the coefficient of coupling.

Air core transformers have losses primarily from the loss of the resonating capacitance and the resistance of the winding relative to winding inductance at one frequency. There can be some additional losses due to coupling to the shielding structure (conductive, all around the transformer) and the reduction of inductance from shield proximity.

A powdered-iron core in any inductor (and transformer) will contain the magnetic field closer to the winding itself. In a toroidal inductor (or transformer) the topology/geometry of the torus does the greatest magnetic field containment. Toroids can be very close (relatively speaking to other shapes) to other conductive elements without appreciably changing the open or away-from any other conductive element inductance.

"Blank" toroidal cores are a standard catalog item such as in the Micrometals product list. That "core" is solid plastic and will have little effect relative to a completely air core toroid. It is very hard to make a self-supporting, completely air-core toroid but it can be done. The magnetic field is less contained than with a powdered-iron core material but that field is still contained more than with a solenoidal core structure.

At lower frequencies, such as AF, various solid iron forms will work just fine as laminations (example: E-I plates) or wound tape (as in toroids). The AF range is several decades of frequency in bandwidth. Very broadband AF transformers, as in old "Hi-Fi" or music systems, can have relatively flat power transfer from 30 to 15,000 Hz, almost 3 decades. Their high frequency response is dictated more by circuit and distributed capacity across the primary windings. The low frequency response is dictated by the permeability of the iron core.

Core material will always affect the inductance value and the coupling of multiple windings on the same core as with transformers. Core material and its form (sheet, tape, or powder) will be broadly frequency sensitive. Certain materials work best at certain octave to decade wide bands for best power transfer in transformers and for least loss component in single inductors.

A good example of very low winding inductance transformers over a decade bandwidth is the "binocular" shape low-impedance matching transformer in most modern-day transistor power amplifiers. The primary winding inductance is on the order of a microhenry for a source impedance of 100 to 500 Ohms and a secondary load impedance of about 50 Ohms. But, the low-frequency end of their operating range is around 3 MHz while the upper frequency end is 30 MHz or more and power transfer is relatively flat over the decade bandwidth. How?

The "how" is more complex than realized. Going back to basics, a secondary winding reflects the secondary load impedance to the primary's driving circuit...but that load impedance is changed in magnitude by several factors, primarily the turns ratio of the two windings; secondarily by the magnetic field coupling between the two windings (or others if multi-winding). A part of the latter is frequency sensitivity to core material other than air. "Looking at" the primary when the secondary is loaded with a pure resistance will show a combination of the primary winding inductance plus the transformed secondary winding inductance as the reactive part at one frequency AND the transformed load resistance plus any loss component of both windings. The impedance presented to the driving circuit is largely resistive. Reactive components of that impedance only begin to manifest themselves (usually) at the higher frequency end. Low frequency end is affected (like the AF transformer example) by the permeability and resultant coupling of the core material, several powdered-iron toroids in two stacks of several toroids each.

With tuned air-core transformers it is almost the same within the resonance range. Resistance components of an impedance predominate, the "transformation" governed by relative turns ratios and amount of magnetic field coupling. Away from resonance the reactive components predominate and the other-winding impedance reflection is much reduced...power transfer from one winding to another is also greatly reduced.

There is some slight parallel to L-C filter structures when compared to an equivalent circuit of a transformer (see various texts). L-C filter structures can also affect a "transformation" of load to source impedance (and vice-versa) but that requires a much deeper examination of the complex voltages and currents circulating in the branches of a filter, in-band as well as out-of-band. In a filter's bandpass, the impedance trans-formation is still a complex matter but a resistive load will show up transformed at the source end (and vice-versa).

A much easier route for homebrewers is to examine how others do their transforming over a specified frequency range and then just copy that. Not a crime or ethical badness. Saves a heap of time which few of us have to spare. If you want "answers" for an academic report you will have to hit the books and figure

it out for yourself. The material IS out there in the libraries.

>really are quite useless at 18khz+

Not necessarily true. That depends on their core material. There are different grades of iron laminations and that is more pronounced with the "wrapped" iron toroidal cores.

Many years ago I obtained some E-I laminations in order to deliberately try to limit high frequency response at a 25 W power level above 3 KHz. When completed, it worked just fine on out to 20 KHz within a db. Wrong ID on the freebie core material. Bought some specific E-I laminations and did it again, this time achieving success. :-) :-(

You will probably not find what you need in stocked, ready-to-use component catalogs. Transformer design and manufacture has become limited and applications-oriented to different disciplines in electronics.

>Do any of you know of a cascaded output section amplifier topology
>capable of swinging this kind of amplitude at freq?

Several. MOSFETs and IGFETs are available on the market today with 1.5 KV breakdowns and higher, conduction capability to several Amperes. You can select those through site search engines at Digi-Key, Mouser, Allied, Newark websites; Digi-Key website has links direct to most carried-product datasheets from the manufacturers. Typical operating rates can go to 100 KHz.

The circuit topologies might be found in industrial control electronics texts or industrial control manufacturers' literature. You might find something similar in industrial ultrasonic cleaning equipment electronics units. Sonar transducer drivers seems a place to look to me, but I've never worked on sonar.

>Many thanks for anyone with ventured knowledge or just thoughts...

Is linear amplification an absolute must in your application? If not and you can go with pulse-width modulation of 50 to 100 KHz switching, possibly followed by lowpass filtering, would be the easier route.

Acetone is a good solvent for nearly all marker pen ink, lacquers,
acetate and nitrate adhesives, polyester and polystyrene, and
most epoxy resins used in making epoxy-fiberglass and
"casting plastic" things. Michael's craft stores sometimes have
acetone, usually have casting plastic and hardener.

OSH (Orchard Supply Hardware) stores carry one-quart cans of
acetone packaged by W.M.Barr & Co., Memphis, TN, for about
$5 (approximately...I stock up from them periodically with other
goodies from time to time) under "Klean-Strip" label. That metal
can has a very tight snap-off, snap-on seal much needed since
acetone is very volatile, evaporates very quickly.

I've been around acetone since teen age times of the late 1940s
and learned to respect its volatility way back in prehistory. Never
had any allergic reaction of any kind to the stuff but some humans
do, physiologically or psychologically (sometimes both). Never
used acetone in a small closed room with no air movement, EVER.
Evaporation is VERY quick. I use it in the garage with the garage
door open. If I am in the workshop, the little fan in there is turned
on when the acetone container is open to the air.

The same precautions should be used with MEK (methyl ethyl
ketone) and toluene and similar "industrial grade" solvents used
for the same purpose. I've not had any reactions to those, either,
but I'm not about to do any worst-case testing using my body...

For one-of-a-kind sloppy-tolerance PCB resist purposes I've been
using the same pale-blue-pigmented acetate-based "model
airplane dope" half-pint bottle from Testors that I got there in

1948. That lacquer was replaced by the modified solvent base "hot fuel proof" lacquers still sold today in model hobby shops. That old "dope" (colloquial name, obviously not PC - politically correct) is much like most nail decoration lacquer. Thinned out slightly and applied with a small, pointed brush it is a very good resist for use with ferric chloride etchant. I do full-size layouts on paper, use that for a drill guide, drill first then apply the lacquer using the paper layout with the drilled holes as a positioning guide. After etching I do a thorough water rinse of the board to remove etchant from nooks and crannies in the PCB, then take a sharp (X-Acto brand) hobby knife to lift off the lacquer...which is returned to the bottle with some added acetone to "melt" it back into its ancestral form. By now the bottle of "dope" is down to a quarter-inch layer at the bottom, needs replenishing for the next half-century. :-)

That PCB etching method works fine for me, is convenient. Other ways of resist and application, other etchants are fine, too.

Sanford pen and ink products are carried in Office Depot and Office Max stores. I'm not fond of the Sanford "Sharpie" since they don't have control on the pen tip's ink trace width to suit 0.1 inch spacings. The Sanford "Expo" pens with "bold color dry erase" ink is worse in my findings...very good for ordinary markings, though, holds great on clear plastic film wrapping tape or cardboard and acetone can clean it off any non-porous surface.

Let's cut to the chase: Here's a few links and law for you to check out at your convenience:

The FCC -does- conduct investigations:
http://www4.law.cornell.edu/uscode/47/403.html
http://www.fcc.gov/eb/

The FCC -does- pursue criminal matters:
http://www4.law.cornell.edu/uscode/47/501.html
http://www.fcc.gov/eb/News_Releases/DOC-225890A1.html

The CFR is just as much 'law' as the USC:
http://www4.law.cornell.edu/uscode/47/154.html subsection(i)
http://www4.law.cornell.edu/uscode/47/303.html subsection(n)

Simply put, the "law" is composed of rules, statutes, codes, regulations, etc. They are all "law" and are all equally enforcable. Now let's get right to the point: Where, in ANY law or ANY regulation or ANY code, does it say that legality is irrelevant?

>So lets not hear another round of your false claims and
>cheap shots.

Then next time don't start it off with shit like, "You are imagining things here" and, "You are going off the deep end with fantasy on every part of this". You might have had some bad experiences with federal law enforcement in the past, but you can't tell me that the FCC doesn't investigate wireless bugs when I know for a fact that they do, and I have seen it first-hand. So unless you have a letter from Powell himself saying that they don't do that anymore, your legal 'opinions' carry as much weight as a gender-dysphoric snail.

Now go ask your lawyer daughter the legal definition of "Whoop dee doo".

You don't read very well at all Frank. Let me put it all by itself
so you can read it slowly several times:

Section 705 of the Communications Act includes criminal
penalties. Accordingly, and in light of its close
relationship to the wiretapping and related provisions of the
criminal code, and at the request of the Department of
Justice (DOJ), it is the FCC's longstanding general practice
to coordinate complaints regarding potential violations of
section 705 with DOJ in order to make sure that our
administrative actions do not interfere with any DOJ criminal
investigation. This is in accordance with a Memorandum of
Understanding (MOU) with DOJ (effective since 1953 and
revised and re-executed in 1989). The MOU specifically
states that DOJ assumes responsibility for conducting
investigations into complaints of alleged criminal violations
of Section 705, and the Commission is to provide technical
assistance when specifically requested by DOJ. DOJ typically
asks us not to investigate until it has conducted its own
criminal investigation and has made a prosecutorial
determination.

Statement of William E. Kennard, General Counsel Federal
Communications Commission ... February 5, 1997

Nothing in your list of non-sequiturs said anything different
than the above.

This coming Sunday....

+++ Now even more Buyers Parking !!!
Thanks to TKT we have use of their new parking lot
across Albany St from the SWAPFEST !!!

!! ** More Buyers PARKING is available ** for details see
http://web.mit.edu/w1gsl/Public/flyer

*** !!!! In our Traditional GARAGE and the adjacent lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday May 18th 2003
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

3449. Re: re-chargeable lithium (Li-ion) battery

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-14 12:45:04 UTC
From: xpyttl <xpyttl_nospam@earthling.net>
Message-ID: <vc4elcepsgto32@corp.supernews.com>
Source record: 35502

NiMH's are a lot cheaper and safer than Lithium Ion, but they have a rather prodigious self discharge rate. If you're like me, and the HT sits in the briefcase more than it gets used, the NiMH's are definitely not the answer. But if you use your HT a lot, they really are quite good, and anymore, they are barely more expensive than NiCd's.

Whether they will provide more transmit time, though, is very much a function of the device. The voltage from an NiMH cell drops almost linearly with charge, where a NiCd will hold it's voltage a little longer. A lot of devices can operate down to a fairly low voltage, in which case, an NiMH will last a lot longer than a NiCd. But if the device needs full voltage, the NiMH can be a lot shorter than a NiCd.

As far as Lithium Ion batteries, these things are very dangerous, and need to have a matching charger. One of the reasons they are so expensive is that they have significant protection circuitry built in. In general, they need to have triply redundant protection against overcharge. In terms of their discharge characteristics, they are a lot better than NiMH or NiCd. But without a lot of care, charging them is a life-threatening exercise. This is why individual cells are so hard to come by. To avoid liability, manufacturers generally qualify the charging circuitry before they will sell the batteries.

Don't mess with Lion unless you really know what you are doing. These aren't the same thing as other batteries.

Of course, it's the toroid shape that gives the coil it's self-shielding,
not the core material. I didn't catch this until Doug DeMaw wrote
about it in the mid-seventies.

The core material is needed because the needed inductance is often large
enough that the core helps, or because one is building a broad-band device
and the permability of a ferrite core works in that favor.

By the time you get to inductances low enough that some sort of core
is unnecessary, you're usually talking of a few turns of wire, and why
waste money on a fancy core at that point, when you can just air wind it?
You're probably going to need shielding anyway at those higher frequencies,
so the self-shielding of the donut-shape may be far less important than
at lower frequencies.

I had not noticed that you could buy neutral toroid cores. Doug DeMaw
showed a few that he had made in that article, I think it was a "Hints &
Kinks", but I've not really stumbled on anything that looked suitable
to make into such cores.

I've learned, in the past year, that the brand of the cells involved means a lot regarding the selfdischarge rate. Some are relatively longlived while others are definitely not.
When I got the digital camera about a year ago I also purchased a quick charger that came with a set of 4 AA 1800 mA NiMH cells that are marked "Digipower" brand, with no further ID. After a few charge cycles they are very satisfactory in their low selfdischarge rate, lasting up to a couple months or even longer. I later bought two backup sets, one Energizer and the other Ray-o-vac brands. The Ray-o-vac set lasts about as well as the Digipower, after cycling them in over several charges. The Energizers won't hold up more than three weeks.

I also carry set of high quality Alkalines along just in case!

Anecdotal, but might be of interest.

Dick

Which is what I was trying to say before. As in the case of a complaint of
wireless eavesdropping to the FCC, that cooperation exists for the FCC to
determine if the devices are being used for authorized law enforcement
activities as per 47CFR2.701 and 15.9.

> This is in accordance with a Memorandum of
> Understanding (MOU) with DOJ (effective since 1953 and

>
>Nothing in your list of non-sequiturs said anything different
>than the above.

Again, since the MOU refers to a Section that is not (or is no longer) valid,
you will need to provide a link.

Correction: Section 705 of the Communications Act = 47 USC 605 (properly cited),
and like 47 USC 501, provides for imprisonment. But that begs the question: By
'criminal' do you mean only a violation of the law where the punishment may
include imprisonment?

I have no idea what frequency range the IFR-1200S covers, but to look
at signals, all you need is a mixer fed with an appropriate LO. It
can help to put a bandpass filter on the front end to avoid images,
and perhaps a preamp if you're wanting to look at low level signals.
But for casual observations, you can just used one of the MiniCircuits
or similar canned DBMs fed by a 50-ohm signal generator for a LO, with
the output feeding a 50-ohm input port on your spectrum analyzer. Add
an input filter and preamp and dedicated LO later if you feel the
need.

Cheers,
Tom

You are contradicting testimony before a House sub-committee by
the General Counsel to the FCC. Stop being funny.

Besides, you've confused 47 U.S.C. §501 with Section 705 of the
Communications Act as modified. Tsk Tsk, not good for a guy who
claims to be holier than thou when it comes to citing laws and
understanding jurisdictions if you can't even figure out that
47 USC §605 is what he referenced, not 47 USC §501.

>> Accordingly, and in light of its close

You have been saying that the FCC investigates criminal
activity, that the FCC will immediately jump right in and is the

primary agency, which should be the first contact for anyone
suspecting criminal use of radios to eavesdrop. All wrong.

You don't seem to have read what the "general practice to
coordinate complaints" is!

The FBI handles *all* such investigations, and the FCC has a
specific, written, agreement with the DOJ to stay out of such
activities until the DOJ (i.e., the FBI) gives them the go ahead
that all criminal investigations are complete.

Clearly the ball is, as I've been saying right from the start,
in the FBI's court. The FCC stays out of it until the FBI is
finished.

>> This is in accordance with a Memorandum of

Don't you think testimony of the General Counsel for the FCC is
sufficient to demonstrate that such a document exists or that it
is what he indicates????

At this point you no longer have *any* credibility. You appear
not to have any perspective on law or communications at all. If
you thing your perception of how it all works is more
authoritative that the head lawyer for the FCC, then to put is
quite simply, *nothing* you say can be assumed correct until it
is demonstrated by some means other than just your opinion. I
wouldn't believe you if someone asked you what time of the day
it is unless I could see a clock myself (and then only if the
clock doesn't belong to you).

Keep grasping at straws Frank. By now you have the entire readership of this news group laughing so hard that rolling on the floor doesn't really describe the effect.

The actual text of that MOU is insignificant. The fact that you can't figure out what part of US Code came from Section 705 of the Communications Act does not mean that it is no longer valid (and in fact it is valid).

Just one more example of your inability to logically follow a discussion and reach valid conclusion.

What *I* mean, is to show you that the General Counsel for the
FCC (who is the author of that statement, which was clearly
cited in my article), says your assertions regarding criminal
investigation by the FCC are all dead wrong.

Go read it again Frank. Like I said it may take several
readings for a fellow such as you. Let me give you a
prioritized list of what you want to achieve while reading it a
few times. Keep reading it until you get each item, *in order*,
totally within your grasp:

1) It is testimony by the most authoritative source possible.

A) Nobody in their right mind will contradict that statement.

B) You demonstrate that you are not in your right mind each
time you contradict it.

2) It says the FCC does not do criminal investigations regarding
eavesdropping.

A) It says they have not done them since 1953.

B) It says they have a written agreement with the DOJ.

C) It says the DOJ does all criminal investigations
pertaining to electronic eavesdropping.

It would be hugely more beneficial to you (and anyone else who
is interested in the details of how this actually works) if you

would cease and desist from trying to debate something you simply do not have the background or the talent to work out on your own.

Instead, if you would *ask polite questions* about why it is different than you think it should be I will politely explain to you how it does function. I'll attempt to provide examples to demonstrate it and provide cites and references for much more intense research. But this business of you spouting off with nonsense and calling me names and insulting my children just because you can't figure out that 2 plus 2 is 5 only for very very *very* large values of 2, won't get you anywhere.

(Stick around Frank, Usenet will eventually teach you how to do better research *before* you open your yap instead of letting someone else push your foot into your gaping orifice. Right now it appears you've been here only long enough to assume that the pushiest person will "win" the debate. It ain't so...)

Hi,
I am confused about the principle of mixing a local oscillator
signal with an RF AM signal to remove the CW.

Is the local oscillator phase shifted to cancel the CW?

Or is something more subtle going on here? Please point me to some
radio newbie references.

Thanks much,
Ed Vogel

Unless I am (and I may be) much mistaken, the mixing isn't to remove the CW (really, to recover the audio), but to get the modulated signal down to a fixed frequency (the IF) where it can be dealt with more easily.

Then (typically) the envelope detector rectifies the signal and a low-pass filter chops off everything above the audio, recovering the audio from the rectified audio+IF.

Unless, as I said, I'm much mistaken.

If you're mathematically inclined (I am; degree in Math, and I do computer science for a living), a good link is

<http://www.ee.byu.edu/ee/class/ee444/ComBook/ComBook/node77.html>

Another is

<http://www.alynk.com/usr/gasperi/theory.htm>

A typical envelope detector is shown here:

<http://engineering.rowan.edu/~shreek/spring02/ecomms/lab3.html>

along with some other stuff that appears to be useful.

I think you may be thinking of the AM detection system known as
Synchronous Detection.

The idea is to introduce a signal in phase with the carrier and THEN feed
it into a detector. This removes the problem of signal fading causing the
carrier level to fall below the detector threshold.

The result is less distortion of the audio when there is a lot of signal
fade due to multipath and so on.

There are several methods used to create the fixed signal in phase with
the carrier, but a web search for 'synchronous detector' ought to find
interesting web sites.

3463. a almost-broken Standard C-58

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-15 21:24:20 UTC
From: Claudio Girardi <please@no.spam>
Message-ID: <3EC40584.E91BD61@no.spam>
Source record: 35516
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Hallo,
I have a Standard C-58 that has some problem, probably with the microprocessor (TMS1300); when I leave it powered, after some time it doesn'respond to the knob or to any button. I have to leave it unpowered for some hour to return to the normal functioning. Has anyone tried to understand if it is possible to change the microprocessor with some PIC ? Could it be possible ?

Thanks,

Claudio

The double-ended ones? Staples sell 'em over here in the UK via mail
order. I tried a few more today out of curiosity and found very good
results from a Stabilo OH pen (universal/permanet) roller-ball marker
with a fine tip that's specified to work well on glass, metal, film
etc. It gave excellent sub-milimetre lines and the marks held up
perfectly well under ferric chloride. Only just over a quid and
refillable, too. Hard to beat, I'd say. I notice no one here's
recommended the Decon/Dalo types...

I'd go DSB rather than AM. Unless you're running high power and have a full
sized antenna,
AM on 80m is a dead loss due to phase distortion and inefficiency. Also
achieving good
AM modulation can be VERY hard, especially with solid state.

DSB sounds just like SSB, is more efficient, better for portable use and
will give you more
contacts, especially with SSB stations.

Peter

>Really?

Really! Here, lets go through this one more time... I'll even slice it
a little different so that you can find the answers to your irrelevant
nits.

"Good morning, Mr. Chairman and Members of the Subcommittee.
Thank you for the opportunity to testify on behalf of the
Federal Communications Commission..."

"Under Section 705 the Communications Act (47 U.S.C. '605), the ..."

"Section 705 of the Communications Act includes criminal
penalties. Accordingly, and in light of its close
relationship to the wiretapping and related provisions of
the criminal code, and at the request of the Department of
Justice (DOJ), it is the FCC's longstanding general practice
to coordinate complaints regarding potential violations of
section 705 with DOJ in order to make sure that our
administrative actions do not interfere with any DOJ
criminal investigation. ..."

William E. Kennard, General Counsel
Federal Communications Commission, Feb. 5, 1997

>How do you explain this?: http://www.fcc.gov/eb/tpsd/ulo.html You can't.

Another non-sequitur.

That is a list of actions taken solely for operating without a
license. None of them involve eavesdropping. And you failed to
notice that all criminal cases were handled by the US Department
of Justice (various Assistant District Attorneys).

>How do you explain why your article and the referred MOU (both of which you have
>yet to provide a link) were ignored in the two cases of suspected wireless
>eavesdropping that I observed first-hand? You can't.

I can easily. You haven't got a clue what happened, and
couldn't describe it logically or accurate if they handed it to
you on a plate.

Your *total* evidence is the statement "two cases ... I observed".

You've not been able to observe anything else related to this
topic and get it right, so I'm not yet ready to stipulate that
the above claim is less bogus that your other claims have been.

>How do you explain why there isn't any CFR, USC, MOU, or any other authoritative
>legal source which declares, as you declared early in this discussion, that "the
>devices being legal is irrelevant"? You can't.

Lacking a document that says there are not relevant is
insignificant, and another non-sequitur.

What *is* logically significant is that you have no document that says
the *are* related.

The simple fact is that the legality of electronic eavesdropping
does not depend on whether the electronic equipment is properly
licensed or not. If the eavesdropping is legal, it will still
be legal if the equipment is found to be improperly licensed.
The operator might be censured for unlicensed operation, but not
"unlicensed eavesdropping".

The two are not connected. The devices being legal is
irrelevant to whether the eavesdropping is legal.

How many times do you need that explained. If you think it is otherwise,
please cite the law which makes it so. Lacking such law... it is
irrelevant.

>Floyd, it is your ASSERTIONS that are "all dead wrong" -- the facts speak for
>themselves.

The facts do speak. As the FCC's General Counsel says, they let
the Department of Justice investigate criminal eavesdropping and
do not get involved except at the specific invitation of the DOJ
or until the DOJ says they have finished their investigation.
That is *clearly* stated by the most authoritative source
possible. Yet you want to argue whether it is true or not...

And you even have the brass to claim that the Cornell School of
Law doesn't know how to cite US Code, that Section 705 of the
Communications Act has been repealed, that you won't believe
what the FCC's General Counsel says is in a written agreement
between the FCC and the DOJ unless you see a copy of it, and
I've forgotten how many other lulus there were.

><snip>
>>(Stick around Frank, Usenet will eventually teach you how to do

>
>This wasn't a competition until you made it one, and now you have lost. If there
>is anything I learned from this exchange is that you get real upset when someone
>challenges your self-proclaimed status as the smartest person in the room.

You are claiming that what *you* have observed the FCC do is the
definition of their methods of operation. That is a
"self-proclaimed status" Frank.

What I did was go find the most authoritative source available
to demonstrate that what you observed just simply wasn't what
you think it was.

(Have you figured out how to locate it on google yet? Try
searching the web for an exact phrase, and choose some part of
what I've quoted. Make it long enough and unique, and you'll no
doubt find exactly the same source that I got my copy from. I'd
give you a URL, but the only way I can get it is to do that
myself, and I see no reason you can't learn _something_ no
matter how hard you try avoiding it.)

For the third time, where's the link?

>>How do you explain this?: http://www.fcc.gov/eb/tpsd/ulo.html You can't.
>
>Another non-sequitur.
>
>That is a list of actions taken solely for operating without a
>license. None of them involve eavesdropping.

You were trying to tell me that the FCC doesn't investigate criminal matters,
but this proves you wrong (from the Flippo case):

"The Federal Communications Commission today announced that an investigation by
its Enforcement Bureau..."

It is therefore VERY relevant.

> And you failed to
>notice that all criminal cases were handled by the US Department
>of Justice (various Assistant District Attorneys).

The Flippo case was handled in a US District Court (as per FCC regs), and was
prosecuted by the US Attorney's Office for that district. That's NOT the FBI, as
per your claims that the agency performs all criminal investigations and
proceedings for the FCC. As I just proved, they don't.

>>How do you explain why your article and the referred MOU (both of which you have
>>yet to provide a link) were ignored in the two cases of suspected wireless
>>eavesdropping that I observed first-hand? You can't.

>the *are* related.

Unbelievable. Are you trying to say that 47CFR 2.701 and 15.9 have no relevance?

>The simple fact is that the legality of electronic eavesdropping
>does not depend on whether the electronic equipment is properly
>licensed or not. If the eavesdropping is legal, it will still
>be legal if the equipment is found to be improperly licensed.
>The operator might be censured for unlicensed operation, but not

WRONG! The FCC and FBI (and other LEAs) have been battling out that issue for years, with the FCC winning every time. The most recent tiff is their dispute with the implementation of CALEA. In fact, there is a case right here in Spokane that's getting some attention because the defense is claiming that a GPS tracking device was illegal DESPITE a legal warrant authorizing the device.

>How many times do you need that explained. If you think it is otherwise,
>please cite the law which makes it so. Lacking such law... it is
>irrelevant.

I have cited the relevant law many times.

Just as I suspected...

http://www.house.gov/commerce/telecom/hearings/020597/kennard.pdf

Kennard's statement was about the use of scanners to intercept and divulge cellular telephone communications. This is entirely consistent with Section 705 which (if you had actually read it) prohibits the improper use of intercepted communications, but NOT the act of intercepting those communications. The acts of eavesdropping, wiretapping, etc. are prohibited elsewhere, and have already been cited. IOW, your quote is "non-sequitur".

BTW, the specific MOU is not cited in the statement. Maybe you can come up with a link for that MOU, or maybe for an MOU with a similar FCC/FBI agreement for violations of Section 301 or 501, which would be relevant to this discussion.

If I had to do all of your research for you Frank, you would have
to pay me quite well. I'm sorry that was so hard for you to find,
but it _was_ about time you learned how to use google.

>You were trying to tell me that the FCC doesn't investigate criminal matters,

I said they don't investigate criminal matters involving
electronic eavesdropping. I said they do investigate matters
involving the administration of CFRs, and that includes criminal
non-compliance with FCC orders relating to that administration.

(This may be hard for you to understand, but if the FCC thinks
you are illegally using electronics eavesdropping they will not
investigate. They'll leave that to the FBI. But if the FBI
tells them that you are using an unlicensed radio device to
eavesdrop, the FCC might well order you to cease using it...
and if you don't stop using it they might investigate not the
illegal eavesdropping, but the criminal refusal to obey a lawful
order from the FCC!)

>but this proves you wrong (from the Flippo case):
>
>"The Federal Communications Commission today announced that an investigation by
>its Enforcement Bureau..."
>
>It is therefore VERY relevant.

Of a criminal failure to comply with direct FCC orders, not for
criminal electronic eavesdropping. It is totally irrelevant.

Your insistence otherwise is one more example of how you are
unable to relate the various jurisdictions and procedures, which
is exactly the reason your observations of FCC actions are
invalid as evidence of what is appropriate response to
suspected criminal electronic eavesdropping.

>>Your *total* evidence is the statement "two cases ... I observed".

You aren't making any sense at all. If your are talking about
rules of evidence, that is not a claim that it is "illegal" in
the sense of criminally liable. Illegal would mean they want to
charge the person with a crime for eavesdropping with an
unlicensed device. I don't think so... ;-)

>>How many times do you need that explained. If you think it is otherwise,
>>please cite the law which makes it so. Lacking such law... it is

You have not. Assertions that unrelated laws apply are not
making your case.

>>Law doesn't know how to cite US Code,
>
>I claimed that YOU didn't know how to cite law. Quit spinning.

You said the material I quoted contained an invalid cite. That
cite was from the material published by the Cornell School of
Law. You couldn't even figure out that it wasn't me that said
it. You later made the same arguments about other text that was
just as clearly quoted from properly cited sources.

>> that Section 705 of the
>>Communications Act has been repealed,
>

>those references will render your point irrelevant. Where's the link?

I'm hiding the fact that I do have other things to do in life
besides spoof feed someone who refuses to understand half of it
anyway. YOU CAN DO YOUR OWN RESEARCH!

>>You are claiming that what *you* have observed the FCC do is the
>>definition of their methods of operation. That is a
>>"self-proclaimed status" Frank.
>
>That is an observation of practiced procedure, Floyd, and it conflicts with your
>quote and MOU (BTW, where's the link?).

Well, see! That is exactly what I pointed out Frank, and here
you are openly admitting it: You have the audacity to claim you
are the authority, by virtue of your eye witness observations,
on what the FCC's legal procedures are.

This comes from the same person who can't seem to relate an
Act of Congress to the US Code to the CFR's that the FCC administers,
and hasn't demonstrated any ability to logically analyze anything
related to those procedures.

But you want to proclaim yourself more authoritative than the
General Counsel of the Federal Communications Commission.

I *AM* impressed!

>Just as I suspected...
>
>http://www.house.gov/commerce/telecom/hearings/020597/kennard.pdf
>
>Kennard's statement was about the use of scanners to intercept and divulge
>cellular telephone communications. This is entirely consistent with Section 705

Exactly. That is called "electronic eavesdropping", and he
explained to the House Sub-committee the relationship between
illegal eavesdropping and that which is not.

Apparently you didn't understand it.

I told you to start with that you'd need to read it several
times. Do you want me to quote you that section one more time,
or can you continue to look it up on your own now?

>which (if you had actually read it) prohibits the improper use of intercepted
>communications, but NOT the act of intercepting those communications. The acts
>of eavesdropping, wiretapping, etc. are prohibited elsewhere, and have already
>been cited. IOW, your quote is "non-sequitur".

Maybe you'd best read it all again. It is a fact that
interception as such is *not* illegal.

>BTW, the specific MOU is not cited in the statement. Maybe you can come up with
>a link for that MOU, or maybe for an MOU with a similar FCC/FBI agreement for
>violations of Section 301 or 501, which would be relevant to this discussion.

There you go again... The MOU is not cited and you don't have a
copy of it to verify that the General Counsel for the FCC in
sworn testimony to the Congress of the United States is telling
the truth. OH MY GOODNESS, what will we do until Frank hisself
can verify it for us???

What a joke.

(I'll take Kennard's word for it over yours every time.)

Mike you are invited to not read anything which does not
interest you. I don't see either Frank or myself forcing you to
read it.

It does happen that I'm getting email which suggests that there
are people reading it; though that is *not* a requirement for a
thread to continue anyway.

3479. Help with id potted choke, transformer

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-18 23:15:25 UTC
From: Robert Mozeleski <moz@ncx.com>
Message-ID: <vcg883gq22eo44@corp.supernews.com>
Source record: 35534
Cross-posted to: rec.antiques.radio+phono,rec.audio.tubes,rec.radio.amateur.homebrew

I need help id'ing these chokes and transformers i picked up today at the local flea mart.
http://userweb.ncx.com/moz/choke.jpg
(120k jpg file). Markings on the transformer are WHEELER K-54J757-2 120V 60CPS 750VCT
220MA. Rather huge transformer with two
large porcelain top caps soldered on. 6 1/2" x 6" x 4 3/4". Might have been part of a
homebrew setup, but i am wondering if
anybody knows the original usage. Markings on the chokes are ACME ELECTRIC NQ-T-151 L-301.
Measures about 1/2 ohm, can't
measure inductance until i bring it to work. Last is a transformer? Seems to have multiple
primaries and or secondaries. And help
is appreciated.

You could use the HV supply from a _small_ TV set, with a long string of extra resistors on the HV output so
> you don't get too much output current. Just an idea... It's not a precise 15kV, but nevertheless should be
> 10kV .. 20kV or thereabouts.
==========
Indeed a HV supply from a TV set or video monitor would do the trick
Some time ago I was lucky to find a HIPOT tester make Danbridge at a surplus store (for equiv US $ 30) . It has such a HV power supply . Breakdown tests can be done at 1 - 10 and 100 microamps , adjustable Voltage Ranges : 3 - 10 and 30 kV
There was no HV cable/probe ,but I managed to make one with a banana plug and a length of HV cable as used in TV sets.
Recently I obtained some spark plug cable (the old fashioned type with a multistrand copper conductor) which I also will try.

Basically, you can't mix and match those things. You're stuck basically trying to find someone who has kept the exact model microphone with the exact frequency (unless you want to recrystal). I see receivers at hamfests all the time but nobody ever remembers what happened to the microphones.

Because they use companding, you can't just use a Shure mike on an Azden receiver and expect it to work decently.

Sure you can! The precise result is infinity. Floating point arithmetic has two useful identities: INF and NaN. NaN is an acronym for not a number, and is used whenever something realy bad happens: it just isn't useful in this context. INF represents infinity, and, while most FPUs will throw an exception with a divide by zero error, all one needs to do is catch and clear the exception (on Windows done by the OS and converted into a "structured exception"), and then set the result to INF. Of course, how easy or painful this is depends on what language you're using. This is all very simple, although it isn't very practical. That said, dividing by zero is something I generally don't want to do. In fact, I generally try to avoid it! In the software engineering I do, a divide by zero operation is generally a consequence of structural instability of a system given the parameters selected by the user. In such a case, it is best to test for a denominator of zero, and, when such a condition occurs, stop the simulation or analysis and notify the user about what has happened.

But I guess, in some respects, being able to get a computer to do anything I want it to do is guaranteed by more than two dozen years experience working with them, and thus knowing what they can and can't do, and thus guaranteeing that I never want a computer to do what I know they can't do. For example, I don't want to spend time making a computer that can speak English, or any other natural language, because natural language is multivocal (i.e. there are many examples of sentences that can have more than one meaning - a common tool in humour), and computers can handle only univocal languages. A computer can neither make nor understand a pun. Of course, down the road, some genius may well be able to prove to me that what I had thought was impossible is both possible and practical; but that is a different question.

> >(I can even get a computer to exhibit behaviours as complex as those of
almost

Indeed it is! I spent a large part of my second doctorate studying this
from different perspectives: philosophy, educational psychology, cognitive
science, software engineering, &c. But it is also a very difficult one and
an area where even experts seem to easily fall into error.

Hi Gary,

I got the mobile one, which uses two 2SC2879 transistors and should give me about 300 watts. A lot of hams in my area are using two or four transistor models and using a 12volt car battery for a power supply. I'm using an Icom 706 rig and this little 5x7" amplifier should look nice sitting next to it. I've been looking for something to build and this caught my eye. I will have a little over $100 for the parts, because I already had a few of the parts in my junk box. If you like, I'll be glad to keep in touch with you....letting you know how I'm getting along and/or if I get it working.

Roln -

The heat-sink is one the most important components for
a solid-state amplifier. If you find a surplus unit to use - I recommend
finding a machinist that can mill it absolutely flat (I'm not kidding) for
attachment
to your PC board.

Ron, W9NUP, built a 1 KW VHF amplifier using 4 MRF 141G modules with a
splitter and combiner running 28v @ 60+ amps.
The amp takes approx 50 watts to drive and fans run constantly for maximum
thermal cooling.

This is not the normal "rat race" type of combining, but rather based on
Myat Engineering's E*Star technology.
Any number of odd or even modules may be employed, making it possible to
grow the amplifier.

Here are some photos on K5OE's Homebrew web page:
http://members.aol.com/homebrewpics/w9nup_front.jpg

http://members.aol.com/homebrewpics/w9nup_rear.jpg

http://members.aol.com/homebrewpics/w9nup_bottom.jpg

http://members.aol.com/homebrewpics/w9nup_top.jpg

Good luck !

It looks like shfmicro.com has downsized their Gunn source inventory.
They no longer appear to sell the 10 GHz MA/COM units or the optional
100 mW diodes that fit them. Anyone know of any alternate sources for
these parts?

Source record: 35401
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.design,sci.electronics.equipment

From the better-late-than-never department, we now have boards and final schematics/BOMs for the general-purpose UHF/microwave synthesizer design that was discussed last year (http://makeashorterlink.com/?B13B320A4).

This synthesizer can generate a CW signal at any desired frequency from the upper VHF region to several GHz with 1 Hz resolution, under the control of either a PC parallel port or an Atmel AVR ATmega128 microcontroller.

http://www.qsl.net/ke5fx/synth.html

Richard Hosking (VK6BRO) and I have just submitted a more complete article on this project to QEX/Communications Quarterly. There's enough information on the web page to build and use the synthesizer, but I'll be glad to forward a (private) preprint of the complete article via email upon request.

Robert,

This looks like ham radio stuff. I would bet that the transformer with all the taps is a filament transformer. You have the HV transformer (caps go to tube rectifiers--probably 866's). Two chokes, of which one is probably swinging and the other not, This made for good regulation between 10% load and full load. I would guess the filament transformer has at least two hefty 2.5V windings and the remainder are probably 10V, excluding the primary of course. Good find!

Carroll

3499. Homemade vacuum tube???

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-20 03:11:13 UTC
From: clamousin <clamousin@carolina.rr.com>
Message-ID: <3EC99CCD.6060205@carolina.rr.com>
Source record: 35402

I am debating on attempting to build a vacuum tube at home. I will need a refrigeration vacuum pump, probably a diffusion pump, and a way to make a seal. I'm interested in this just to see if I can. The plan as it stands is to use a nichrome wire as a heater and copper for the indirect cathode. I may use some type of tarry substance smeared a couple of inches on a piece of wood and embedding the end of a jar in it. I've heard of a book by van der bilj called the thermoelectric vacuum tube from the early 20's to help me with specifics. Has anyone heard of this book? Has anyone already made attempts on a project as crazy as this? If I can get a graph of the tubes vitals, maybe I could try to build a regen around it.
Tnx,
Chris

H. Peter Friedrichs, the author of "The Voice of the Crystal" (available from www.lindsaybks.com - and no, I don't have any financial interest in it!), has been experimenting with making his own vacuum tubes and point-contact transistors. Perhaps he can help you out. I don't know if he wants his e-mail address posted to a newsgroup, so I will send him a copy of your original posting privately and suggest that he post a reply.

I would skip the indirectly heated cathode, and use a center tap
grounded heater supply. If that works you can go for an upgrade.

Wood is a terrible thing to use around vacuum, because it keeps
releasing gas even if none leaks through from the outside. It is full
of closed cells full of gas. I would seal the leads with epoxy with a
piece of glass tubing going through so you can connect a vacuum pump
while the tube is being tested. If you like what you see, just melt
the glass tube shut (and separate it into two pieces) with a propane
torch, while the pump is running. A triode should be pretty easy.

The first time that I thought about the vacuum in tubes I tried to
figure how they did it. I just thought that they heated the whole tube,
then sealed it. The vacuum formed when the tube cooled. Sorta like the
vacuum formed in canned goods during the canning process. Maybe passing
an inert gas into the tube so contaminants could be flushed out.

I am surprised to think that a vacuum pump was used. Anyone know what
the commercial guys do or did?

I have no knowledge of the commercial process. I may be wrong. (It has
happened before :)

>I got the mobile one, which uses two 2SC2879 transistors and should give me
>about 300 watts.
Hi Roln,
I see the one your are talking about now. I have not built this amp, but I have built solid state amplifiers using the circuit boards from Communication Concepts. I think they have the equivalent to the one you are going to build. From my experience, if you have the parts and instructions, you know that the circuit board with the rf transistors is just a small part of the overall amp. You must have a suitable heat sink, one with heat spreading material built in, or use some copper sheet for heat spreading, and bolt that to a heat sink. A cooling fan is not a bad idea. You have to have t/r relaying. You have to have a Low pass filter for each band you intend to operate. If you intend to operate multiple bands, you have to come up with a band switch to change filters, or have plug in filters for for each band. I notice rf parts said you *may* need a filter. To meet FCC specs. on spectral purity with this type of amplifier, you *will* need filters.
An ALC circuit would be nice to keep you from overdriving the amp, and some reverse power protection might keep you from smoking the transistors if your mobile antenna or transmission line has problems. Mobile antennas have more problems than fixed ones, or at least my mobile antenna does. I copied my alc protection from the Ameritron ALS 600 solid state amp.
It would be slightly more trouble to get 2 boards and suitable splitter and combiner circuits and get 500-600 watts. I think that is about as much as a 12 volt auto electrical system will handle. I have talked to several mobiles running 500 watts.
You probably knew all this, but if you want any details on any of the auxillary circuits, drop me an email. Good luck, and let us know how it turns out.

Note that commercial small receiving tubes have a "nipple" - at the top in the miniature tubes, hidden in the black phenolic base in octal and loctal tubes. I presume that's where they melted the pump tube closed.

Which begs the question, what happened to the "nipples" on tubes with plate caps? You'd think they'd have to have one at the bottom but I never see any evidence of that.

I'm also curious how they manage to raise the vacuum in ceramic tubes, like the ones used in broadcast transmitters. (3CX800 etc.)

I think they have a soft copper tube that is cripped off and braised
closed to retain the vacuum in the long-term. The same with the all
metal envelope devices.

Greetings All:

I have a surplus Vectron model CO-245B19-J 10 MHz OCXO. I
understand these are very stable oscillators (.001 PPM/24hours???) and
I wish to make use of it as a frequency standard.

It is mounted in a rectangular can about 4 inches tall and 2
inches square with an 8 pin octal plug on the bottom.

I wonder if anyone in this group happens to know where I might
find a specification sheet with pinout information for it?

Many thanks in advance for any help!

73 & Enjoy!

Ahhhhh Vectron...that name brings back memories. I worked in satcom for a few years and we built a lot of our own equipment. One of our requirements was for a very stable VCXO in the 60MHz range with wide deviation chracteristics (some said impossibly wide). Vectron was one of the vendors I found who was willing to try and make these for us.

After much gnashing of teeth they did!

I have some experience with vacuum.

A common technique with glass is to start with a premade shape, with a long tube at one end. This is hooked up to a high vacuum system, and the whole system is pumped down, typically into at least the 10 ^-6 Torr range.

If you want higher vacuum (less remaining gas molecules) heating prior to sealing, and/or waiting longer will help.

Diffusion pumps are older technology, more modern setups would use either a cryopump or a turbomolecular for the hivac part.

Once it is down to vacuum, a portion of the glass tube is heated to a taffy-like stage, and the external atmosphere will push it closed until it seals together. Then it is broken off on the non-vacuum tube side, a little more torch to round it off, and it is ready to go.

Non-glass enclosures such as ceramic or metal typically use a metal tube as described above. Pure annealed copper forms a very good seal, which could be backed with solder or braze.

A concern with a vacuum tube is the feedthrough wires that electrically connect to the interior filaments. If they are not a material with a similar coefficient of expansion to the glass used, you can develop micro-leaks there. Special metal wires are used, matched to the Pyrex commonly used here.

Inside the vacuum portion, as mentioned earlier, some materials outgas significantly and should not be used in a real vacuum. Metals, sealed ceramics, and glass are the best choices inside.

Happy trails,
Gary (net.yogi.bear)

Tubes still have quite a following amongst the golden-eared audiophile crowd and electric guitar players, and Ned Carlson of Triode Electronics caters to that market. On his website is a lot of tube information, including information related to tube design, tube materials and tube manufacture:

http://www.triodeel.com/mailbag.htm

And that item is pertinent to ham radio, how? Exactly?

If I want a stereo, I'll go buy a dedicated one. It's neither
necessary nor desirable (to my view) to turn a PC into a cheap broadcast
receiver.

I've found acetone to be readily available at paint stores, and in the paint department of home-handyman stores. It's probably less expensive there than at craft stores.

Hi all,
IMHO, barium was the main component. The mixture was evaporated after the tube was exhausted and separated from the vacuum pump. It forms the "mirror" on the top of miniature tubes. (If gas gets inside, the mirror turns into white powder.)

Hi all,
putting sealed wires through Pyrex glass is a hard task for an average
ham. Most epoxy resins do not outgas much if mixed and hardened
properly. They may be a perfect material for homebrew high-vacuum
devices, even for a long-term sealing.
Special wax, fat and cautchouc mixtures are used for temporary vacuum
sealing, too.

3523. NE602 Balanced Modulator Problem

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-21 07:48:52 UTC
From: n2cqr@clix.pt
Message-ID: <97f305da.0305202348.6c2f3169@posting.google.com>
Source record: 35425

I'm using an NE602 as a balanced modulator in my 20 meter QRP DSB transceiver.
Sort of the same design used in the Wee-Willy rig. VXO into pin 6 (unbalanced). Audio (from an LM386 serving as mic amp) into pin 8 (also unbalanced).

I'm getting disappointing levles of carrier suppression. I don't have the gear to measure it accurately, but I'm getting more carrier than I got when I used diode modulators on earlier rigs. I estimate that the carrier is about 10 db below voice peaks. I should be doing better.

Any thoughts on how to improve carrier suppression with the NE-602? I've tried reducing the signal level at pin 6. This seems to help, but not enough.

Would it help if I used a balance (two pin) input for the VXO input?

Check your pinouts against the datasheet.

Pin 8 is supposed to be Vcc, typically between 4.5 and 8 volts. Pins 1 and 2 are the main input, and pin 6 is the LO input (base of the oscillator transistor).

3525. Checking an Electret Microphone insert...

Source record: 35427

Hi,

I have just found out that my hands free mobile microphone is not
giving the radios any audio.

I have checked all the interconnecting leads etc and have traced the
fault back to the neckband. The wire from mic. to connector is fine so
I am beginning to think that the insert is faulty.

It is a direct short. I am not sure if this means it is faulty or not
as I don't know a great deal about electret microphones at all.

Any confirmation would be appreciated as all I need to know is 'do I
need a new insert'...

Cheers in advance,

73, Iain (M0PCB)

No it shouldn't be a direct short.

An electret mic is just a capacitor basically, so it should be open circuit.

But then, it depends if theirs any other circuitry inside it, some electrets
that are used in radios have built in circuitry, yours prolly hasn't though.

Clive

Hi Clive,

That's what I was after. Not sure what's inside the capsule itself but
it is a dead short across the pins. There is a thin mic. cable from
the neck bands to a small box with the driver circuit etc in it. Made
by Mobilite/Heatherlite...

Right, off to get hold of a new insert (wishing I had got some at the
last rally/junk sale as they were really cheap!!)

Cheers,

Iain M0PCB

Most hardware stores and home centers will have it, usually in the
paint department.

You probably do not want to buy vastly more than you will be using
short term, as it is far more volatie and flammable than gasoline. A
pint or quart might be better than a gallon for most people.

Seal it tight, there are few things which evaporate faster than
acetone.

Fumes are bad for you to breathe, as well as highly flammable. Use
only in a very well ventilated area away from sparks and flames.

High concentration alcohol is a good solvent for many inks.

The special wires with glass sealed around them is probably beyond a
home workshop. Kovar is the special alloy which expands and contracts
at the same rate as Pyrex.

I am sure someone adept with glass work could recycle the existing
passthroughs from an old tube into a new one.

Good epoxy is not too bad inside a vacuum, but those other materials
will limit how good a vacuum is possible.

Rather than reuse old tube odd's & ends, go by your local neon sign shop, They use kovar wire on their electrodes, get some broken or "old ends from a sign they have rebuilt., crush the glass and salvage the wire. Also the glass blower may be willing to help you. There is an old book (by RCA IIRC) that gives a lot of details on cleaning etc for tube production.

3532. Re: Significance of inductance in transformers

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-21 16:55:39 UTC
From: Roy Lewallen <w7el@eznec.com>
Message-ID: <vcnbs7lstiq8d@corp.supernews.com>
Source record: 35435
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.antenna

Winding impedance, whether inductive, resistive, or a combination, appears in parallel across the transformer winding. So to keep from disturbing the circuit the transformer is connected to, this impedance should be considerably higher than the impedance of the circuit. Making it more than 5 or 10 times greater than the circuit impedance doesn't cause any problems, but it's often hard to do and a waste of effort.

Many of the ferrites used for broadband transformers exhibit primarily resistive winding impedance at the frequency of use. This is often an advantage over inductive impedance, since it stays relatively constant over a wide frequency range and doesn't introduce undesirable resonance effects. A purely or almost purely inductive impedance is only necessary when enough power is involved to make transformer dissipation a problem.

While learning transformer design at Texas A&M, we used a rule-of-thumb
of 10x. I notice that 5x seems to be acceptable for a balun.

Perhaps indium or an indium alloy?

Along with a little borax as a flux, you can get solder to adhere to
some interesting materials.

Tom

In general, the Vectronics kits have tended to be a bit marginal, although they are cheap and widely available.

The SW-40+, on the other hand, is widely respected, and there is a LOT of information on the net about it, including a wonderful web site by VE3DNL which is also on the QRP-L CD. The downside is that Dave Benson is pretty well swamped, so his delivery times aren't great, but you can check on his web site how long the wait is.

..

3540. LED conversion help needed for Lightsaber Toy

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-21 18:45:21 UTC
From: johannzimbal@yahoo.com
Message-ID: <a3bc7b40.0305211045.249f6ff6@posting.google.com>
Source record: 35443
Cross-posted to: sci.electronics.design,rec.radio.amateur.homebrew

Hi,

I want convert a Star Wars Electronic Ligtsaber toy to use LEDs instead of the 2.5 V flashlight bulb currently in there. The goal is to get a much much brighter output.

The toy is basically just a flashlight that uses two 1.5V C cell batteries (end to end)

I bought some red Jumbo Super Bright LEDs from Radio Shack, but I'm not sure if they will end up making things brighter than the flashlight bulb in the long run.

Each LED is rated 2.4V, 20 mA, and the intensity is 5000mcd.

Hooking up the LEDs in series seems simple, and I know how to solder. I'm not sure how to hook up LEDs and resistors in parallel, so please let me know if that is the answer. I'm a bit of an electronics novice.

I'm not as concerned with battery life as I am with extreme brightness.

Thanks a lot for your help,

Johann

Try about a 68 ohm resistor in series with each LED.

```
+3 -x---|>|---[68R]---x--- 0V
| |
x---|>|---[68R]---x
```

Measure the voltage across the resistor (should be around 1.36V),
calculate the current and then adjust the values to get closer to 20mA
if it's more than about 1.6V or less than about 1.1V.

Best regards,
Spehro Pefhany

Ian , I have plenty electret mike capsules ,salvaged from telephones . Most have dimensions : dia 10 x 8 mm
1 salvaged from a mobile phone has dimensions dia 10 x 4 mm . Most have 2 connections with leads red (+) and brown (-)

I can send you 2 pcs free of charge . If you are interested please confirm your post code , which to my info is DL15 8EX as from callbook.

>> . . .
>
>I've found acetone to be readily available at paint stores, and in the
>paint department of home-handyman stores. It's probably less expensive
>there than at craft stores.

Klean-strip products (mentioned for OSH, Orchard Supply Hardware
chain) are also carried by Home Depot. The Lowe's chain has
comparable products in their paint departments as does Do-It
Centers. Prices vary but will be about $4 a quart. Note: Not all
chain stores will stock it so it is worthwhile to visit in-person and
check it out.

For general information on acetone, the Canadian Occupational
Health and Safety page at:

http://www.ccohs.ca/oschanswers/chemicals/chem_profiles/acetone/

is a good one. My late father-in-law was a polymer chemist
specializing on paint products used in production silkscreening
and printing. [he survived nicely well into retirement by taking
precautions on the job]

On a related note, Do-It Centers in Southern California have a
surprisingly large variety of metal and plastic materials good for
homebrewing electronics. Metal bar and angle stock, threaded
rods of many sizes, punched metal sheet in various patterns for
grilles, screens as part of air-passage shielding, and so forth.
Other do-it-yourself places have similar selections of materials
worth investigating.

Not quite true for "most" epoxies. Jet Propulsion Laboratory in
Pasadena, California, has a large polymer chemistry lab and
evaluated hundreds of different epoxies having potential application
in spacecraft. Extremely few types/brands met the test for very
low outgassing. Open space is a fairly good vacuum... :-)

>They may be a perfect material for homebrew high-vacuum
>devices, even for a long-term sealing.
>Special wax, fat and cautchouc mixtures are used for temporary vacuum
>sealing, too.

Not recommended for anything needing to be pulled down to
10 to the minus 6th Torr...and that will be needed for any
sort of functioning vacuum tube/valve.

Bill Higdon's suggestion of a neon sign shop as a source of
seals sounds reasonable. That brings to mind a very few
homebrewers who are experimenting with making their own
Nixie tube numeric indicators. Since Nixies aren't made any
more (that I know of), their gas mixture is close to neon sign
pressures and might be a better start for hobby work. No
extra test equipment needed for tube/valve characteristics
since the numeric display is either on or off and the eye can
judge enough brightness for "good" or "bad" glowing.

On the advice of a friend, I switched from regular heat sink compound to Silver thermal compound sold by Comp USA. My 8 MRF150 1200 watt SS Amp seems happy. Of course it seemed happy with the Silicone based stuff also.
There is a spec. called thermal conducitivity on this Silver stuff, and I would assume the better this spec., the better the compound.

It's been quite a week. Last week my house got struck by lightning. It hit the top of the chimney
and took out a piece of the stone top cap. It discombobulated the damper, came down the damper
control cable (melting it) and then came out the fireplace with a burst of EMP like a small
thermonuclar device went off in there. My computer setup is in the family room until my new
hamshack is built, and that's where the fireplace is. An epson photo printer got fried, my
computer as well. Then the surge took out two network hubs, travelling through the eithernet
it took out two other computers in the house. My 40" direct view tv still works, but the tube
was gaused and has color fringes in the corners. It can't be degaused by the sets internal circuits.
Hopefully a storng external degausing coil will fix this and we won't have to replace the CRT.
Two of the computers are now back up thanks to new motherboards and network cards,
but my computer still needs a new sound card and a scsi card. The replacement Tyan
motherboard wouldn't come up at first, I had to discharge the cmos before it would even
turn on the power supply. Weird! We will probably be finding other blow electronics
for the next few weeks. (Hey the battery powered atomic clock in the family got reset to
some other time zone! It did reset itself though).

Learn glass blowing! You can get the required dumont wire
for the leadins from old broken light bulbs (the larger sizes
such as 200 or 300 watt are the best sources). The lead in

wires are pinched in a blob of molten glass.
Get a goot hot mapp gas torch and some glass rods and
experiment with melting and forming glass. You will
see how it can be done.

I haven't seen the stuff, but I've seen it advertized. Is it actually
silver colored? If so, I'd be concerned that it contains electrically
conductive metal particles.

These would not be a problem in computer CPUs, where the paste is
applied to the TOP of the chip, away from the pins which are at less
than 5V. But in a power amp of any kind, where there is likely to be
tens to over a hundred volts insulated by a thin separator this seems
unwise.

If this stuff is really all insulating, then of course these concerns
are irrelevant, but then I've got to wonder if this stuff can actually
be any better than the usual stuff which even the best equipment comes
with.

From arctic silvers website http://www.arcticsilver.com/
"Negligible electrical conductivity. Arctic Silver 3 was formulated to conduct heat, not electricity. It is only electrically conductive in a thin layer under extreme compression. (While much safer than electrically conductive silver and copper greases, Arctic Silver 3 should be kept away from electrical traces, pins, and leads. The compound is slightly capacitive and could potentially cause problems if it bridged two close-proximity electrical paths.)"

I would not use it for RF applications. Use a good grade of thermal compound. All that is important is to keep the device's junction temperature with in manufacturers specifications.

Go for the slow cure kind of epoxy (Dexter Epoxi-Patch 1C is pretty
good), not the 5 minute stuff (which never gets much harder than an
old booger). After it cures over night, bake it out at about 140 to
180 degrees F for an hour or two. This is especially effective if you
can hold the inside under vacuum pump down while hot to pull out any
volatiles that are near the surface. It may not hold good vacuum for
decades, but it will do well enough for some very useful experiments
ands is much simpler than learning to become a glass blower.

Hi,
I salvaged some nice higher-voltage capacitors from an very large UPS.
The caps are tubular, potted, and wrapped in a bright yellow plastic
tape with printing on it. They appear to be unpolarized.

One of them, a 0.22 uf unit, has two voltages printed on it:
1500V cc
500V ca

What does this mean? Why the two voltages? Transient max vs steady max?

Another one is clearly a 1.0uf unit, of the same physical description,
though obviously larger in size. It reads:
630V-
330Vef 12.5Aef

What does this mean?

3561. Re: Heatsink compound for SS amps

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-22 07:08:07 UTC
From: Roy Lewallen <w7el@eznec.com>
Message-ID: <vcotqhs577om71@corp.supernews.com>
Source record: 35363

There's a technique to using heat sink compound that doesn't seem to be generally known. The difference in thermal conductivity between air and metal is many orders of magnitude. Heat sink compound is in between -- it's several orders of magnitude better than air, but several orders of magnitude worse than metal. So you want to replace air with thermal compound, but not metal. The ideal amount of compound to use is just enough to fill the tiny pits and imperfections in the metal surfaces, but no more. Any more than that, and you're doing more harm than good by making the heat unnecessarily flow through compound before reaching the metal. Use it very sparingly for the best results.

Roy Lewallen, W7EL

What sort of balancing arrangement do you use? I increased the S042P
balance - as mixer - by over 40dB using the usual balancing potmeter

==========
High intensity LEDs are increasingly used for reliability ,including in
traffic lights , each having a panel of up to 225 LEDs.
I was given such a panel which happened to be defective (but not the LEDs)
These LEDs are very sensitive and start to glow at 20-30 micro-amperes
,which makes them suitable as a detector in a RF reflected power sensing
circuit (very suitable for portable QRP applications)

You're not the first or last to have devices damaged by lightning. It has happened to me twice and once to a friend. In my case, it hit a nearby power pole and took out the computer and laser printer. The motherboard on the computer was replaced and the laser printer was repaired by the maker (GCC Technologies) without charge.

A week after everything was repaired, lightning hit again. This time it came through the telephone line and took out the modem, computer, and laser printer again. The interior of the modem was well burned and in pieces. The modem was replaced, the motherboard replaced a second time, and GCC repaired the laser printer again without charge.

However, my problems were mild compared to what happened to a friend. Lightning hit a nearby pole and took out his television, stereo, several other household items, and nearly took out his son. His son was getting something out of the refrigerator and was thrown across the room. However, other than being dazed for a while, his injuries were limited to bruises from the cabinet he landed against.

Today, I unplug just about everything when lightning is in the area. About the only things that remain connected are the appliances and I stay away from them until the lightning has passed. Of course, my radio equipment is also fully unplugged and the antenna coax disconnected before it even enters the house.

Not that simple.......

LED efficiency is currently on a par with tungsten halogen incandescent lamps. Flashlight lamps are usually not halogen lamps, they may be boosted with a krypton gas fill which gives them brightness over lamp life.

Watt for watt an LED will be more efficient than a standard incandescent lamp in open white, compared to a krypton filled lamp probably less so.

LEDs come into their own in a couple of circumstances, where the avalable power is very low, 20mA incandescent lamps are rare.In these circumstances LEDs will offre useable light output and /or extended run time.

Where the required output colour is other than white, filtered incandescent dumps a large amount of the enrgy used as heat on the wrong side of the coulour filter. LEDs generate a single coulour from their consumption of the energy, blue being possibly the most striking example as blue output from an incandescent is very low but a blue LED is suprisingly effective.

For the OP output in milicandela is a function of beam angle , wider spread equals less mcd. Jumbo as in 10mm against 5mm LEDs are jsut a bigger package the LED chip in the middle is no bigger or brighter.

Tom,

Another rig to consider, if you want to go mono band, is the
Wilderness Radio Norcal 40A. This rig has one of the best receivers
in this category of single band rigs. It can also be easily modified
to go the whole bucket (5W) of power.

The NC40A from Wilderness is a bit more expensive but it comes with
the case, connectors, and basically everything but a key. I would
highly suggest you get the KC-1 Keyer/Freq announcer as well.

I built this rig with the KC-1 back in 1998 and I still use it today.
It's my "go camping" rig, along with the Emtech ZM-2 antenna tuner.
The construction documentation is superb and Wilderness has fabulous
tech support...as does SW Labs.

The NC40A was designed by Wayne Burdick (now of Elecraft fame)and it's
just a great little rig.

My other "go camping" rig is a SWL 30+ for 30m operation from the
tent. It's a very nice rig, I've added a freq counter and 10 turn pot
to mine.

73

http://www.fix.net/~jparker/wilderness/nc40a.htm

I have no financial interest in either company.

I have bunches and gobs of them, removed from equipment and new. What characteristics do you need? Idss especially would be nice to know. If you just need one or two, I could drop them in an envelope and sent them along. IIRC, the lion's share of what I have are around 1mA Idss, and were used in DC--audio-range amplifiers. May well be fine up through HF and low VHF at least.

Cheers,
Tom

Yes that triggers the old mind, it was indium because the spool box label had Indium as a major constituent and when I asked the seller what it was for he said; "Indium will wet glass (tin) so that you end up with a better seal." I wonder if salvaged wires from tubes or lamps would have enough to make it reuseable. I also wonder if the neon sign makers use anything, maybe not since the pressure up with a bit of some rare gas, at what pressure I wonder?

1) the amount of a solder actually on a wire is very small, and you
cannot remove it all easily if it is any good as a solder. Also, the
parts exposed to air will likely oxidize, which makes the job of the
flux that much harder.

2) Even when a tube is backfilled with a gas, standard practice is to
pump it down to the same high vacuum (2x10^-6 is typical), and then to
introduce a pure gas. This reduces harmful contaminants such as
oxygen, water vapor, or oil fumes. Typical pressures will vary, but
always be a small fraction of an atmosphere, say 50 to 100 milliTorr.

Happy trails,

It is always advisable to find out what is available off the shelf
http://www.orenelliottproducts.com/index.html

OEP is (or has been) a major supplier for Drake, Collins, Heathkit, almost
every tube amplifier manufacturer,
and many antenna tuners, etc,

OEP is providing HW-8 owners with replacement capacitors for their rigs, at
very reasonable prices, over 10 years
after Heathkit has been out of the kit business.

Check out their M73 product line.

Oren Elliott Products, Inc. is the largest domestic manufacturer of
air-dielectric variable capacitors
During World War II, we supplied the Allies with 3500 capacitors per day,
and by the end of the war our company was the world's largest producer of
air trimmers.

OEP's ability to manufacture subcomponents in-house (particularly via
flexible processes like CNC machining) enables us to produce highly
customized assemblies with short lead times at low cost. We've produced
several capacitors that don't fit into any of our standard configurations,
some built to a customer's specs, some developed jointly with customers, and
others engineered by OEP to perform electrically and mechanically to a
customer's requirements.

Some of these customized caps have been air variables made as a drop-in
replacement for other manufacturers' capacitors, matching them dimensionally
and electrically. Others have been more radical departures from our standard
line; they've included fixed air capacitors, fixed Teflon-dielectric caps,
screw-type air-dielectric trimmer caps, several screw-type
Teflon-dielectric trimmer caps, pressurized-gas-dielectric variable
capacitors, and liquid-dielectric variable capacitors.

They also produce variable inductors
http://www.orenelliottproducts.com/variable.htm

Is that Guy-ger? or Gigger?
i.e. is the 'i' pronounced 'long' as in the word hide? e.g.
Gyger-hertz.
This sounds more "igh class like you know, what?"
Or is it pronounced 'short' as in the word hid? Giga-hertz.
Just curious?
Terry. Ex scouser.

I have heard it only with the second one, the short i sound. Both the
hard and soft G from various people.

Not sure what the Brits do, they pronounce many words differently from
we Americans. The Canadians are somewhere in between.

Everyone got used to Mega. Now it's Giga. Soon Tera.

Happy trails,

3581. MFJ QRP rig Question

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-23 02:37:33 UTC
From: ku4uvham@aol.com
Message-ID: <20030522223733.20276.00000125@mb-m01.aol.com>
Source record: 35384

I have been thinking about getting into QRP operating for some time now and was considering the MFJ 9040. I don't really have the time or equipment to sit down and build a kit, so the 9040 seems like a logically choice, and it is within my budget. The thing that concerns me is MFJ's quality control with these radios. I have read reviews that say the radios drift quite a bit and have had other problems. I was wondering if anyone else has bought one of theses rigs recently, and whether or not MFJ has ever got around to fixing some of the problems with the radio. Please e-mail me and let me know your thoughts.

Go the Elecraft web site, select a builder in you area, and have an Elecraft built for
yourself. There a number of builders -- who just like to build the kits !!

The K1 is about the same price as the 9040 and more flexible (bands) and the quality is the builder you choose --
and there are a number of top builders available.

The K2 gives you expansion capabilities you can grow into (voice, power, tranverters)

3583. IR repeater

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-23 03:46:32 UTC
From: Joel <joel@cyberbest.com>
Message-ID: <OQgza.2712$Lu1.848838785@twister2.starband.net>
Source record: 35386

I have my house wired with coax and a modulator to allow all the TV's in the house to use the DirecTV satellite. We have two receivers (his and Hers) and two remotes. She watches the TV on channel 20 and my channel is 30. The modulator puts the two satellite receivers on those two channels and the locals on the normal channels. This all works great. To allow us to change channels in any room, we have a few RCA D935 IR repeaters sprinkled around the house. They pick up the IR signal and transmit it to the remote receivers and this also worked well for a few years. But now the IR repeaters are starting to get flakey. We are down to just a few working. With all that said, I was wondering if anyone had either a schematic for these units or other ideas of how to do the IR repeating. I 'think' the problem is the IR transmitters are drifting off frequency as I can make one work for a few months by bending the little loop of the oscillator. I can't seem to measure the frequency it transmits at, so I can't set it to any standard frequency. I was thinking of building my own rf transmitter to replace that portion of the ckts. But maybe you guys have a batter idea or even a ckt or two that would work.

3585. Novice transmitter challenge

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-23 12:11:32 UTC
From: achilles03@hotmail.com
Message-ID: <fef44ceb.0305230411.1b24930c@posting.google.com>
Source record: 35388

I'm not much better than a novice in the field of radio, but because of a project I'm involved in, I'm hoping to find a potential transmitter solution.

Let me pose the question this way: for an airborne system approaching 100,000ft, what are possible transmitters/frequencies/modulation-type solutions I could use that would be capable of transmitting an audio signal to a ground receiver, approximately 40 miles away (plus the 20 miles delta 'h').

In addition, I'm working with a limited budget, have a total payload capacity on the order of 2kg or less, and am not licensed.

Any suggestions? :-)

Thanks in advance for advice anyone can provide!

Dave

The advice to have an Elecraft built for you is excellent. Their designs (and quality) are the very best out there (including the offshore stuff), and light years ahead of anything MFJ will ever come out with.

What's the purpose of the information being transmitted? Are you in the U.S.?

It might prove easiest to obtain an amateur radio license and use ham frequencies. There are limitations on the purpose of communications that's permitted on the amateur bands, but if your purpose is non-commercial scientific curiousity you should be fine.

Amateurs *have* done this kind of communications.

IF we knew more about you desire "challenge" .... better information could be provided, otherwise at this stage of your

inquiries I would suggest "google.com" for research and education purposes.

There is an enormous amount of information available on the web regarding high-altitude ballooning and APRS based experiments.

Below is a list of interesting and/or useful sites which have quickly made their way to my favorites list.

a.. Reno County Kansas Amateur Radio Association (RCKARA) - www.rckara.org. This is our group's website. We try to keep it as up-to-date as possible regarding our ballooning activities.

b.. Tucson Amateur Packet Radio (TAPR) - www.tapr.org. This group of amateurs is dedicated to the development of new digital technologies.

c.. Kansas Near Space Project (KNSP) - www.ksu.edu/humec/knsp/knsp.htm. I don't think this site is being updated any more, but they have a lot of good information and photos on the site.

d.. Treasure Valley Near Space Project (TVNSP) - www.the-one.com/tvnsp. Paul Verhage (KD4STH) who initially got our group started has moved north and is now involved with the TVNSP.

e.. Nebraska Stratospheric Amateur Radio (NSTAR) - www.members.home.net/mconner1/nstar.html. A group of amateur's near Omaha, Nebraska.

f.. Edge of Space Sciences (EOSS) - www.eoss.org. A very active balloon group in Colorado. They have done a number of flights with ATV on board with satisfactory results.

g.. High Altitude Glider Project - members.shaw.ca/sonde/index.htm. A Canadian who essentially built a radio controlled glider the flies home guided by GPS. Many of the same technologies as the ballooners are used on it.

h.. Findu.com - www.findu.com. This is a website that collects APRS information from various gateway located across the country and posts them to this website. A typical balloon flight will find its way onto this site because of the range from which the balloon can be heard.

i.. Microchip - www.microchip.com. This is the supplier of the PIC chips. They have a lot of information on their site about their chips.

j.. Custom Computer Services (CCS) - www.ccsinfo.com. The maker of the C compiler that I use. Because of its price, it is well known in amateur circles.

k.. DonTronics - www.dontronics.com. A provider of the WARP-13 PIC programmer that I used to develop this project

3592. 450ohm Ladder-line rolle up J-pole question!

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-23 18:22:24 UTC
From: Jeff <kb1hol@REMOVETHIS.arrl.net>
Message-ID: <kb1hol-E30CF8.14222423052003@news.mindspring.com>
Source record: 35395

Hello!

I have constructed a roll up J-pole antenna from 450ohm ladder line for
2 meters. It works quite well with a 1.4-1.2 SWR across the bandwidth.

My question is what are the power limits for this antenna? I have seen
that the same antenna made with 300ohm "twin lead" is suggested to keep
under 10 watts on VHF. What about the heavier 450ohm ladder line that
I've made this antenna with? Could it handle 25 watts? What about 65W?

I've got a Yaesu FT-2800 2 meter TXR that I'd love to pair it with since
I live in an apartment with no method of installing an external antenna.
Likewise, a 1/4 wave 2M groundplane is impractical in our livingspace.
The J-pole can happily be hung in the corner of our bedroom near the
window with no fuss (and no complaints from my other half! :)

Thank you!

Gary:

Are you quoting pressures for neon tubes, or radio tubes? If you mean
radio tubes, I think the pressure values you quote are way off. As I
understand it, the vacuum values should be at least a 100 times better.

At one time, gassy triodes were manufactured for use as detectors, but
in most other cases, any gas present in the envelope is a liability. Gas
ionizes, which limits the operating voltage of the tube. Also, gas
molecules can cause deterioration of the filament, and internal short
circuits due to the effects of sputtering.

I was meaning the neon tubes, as that was what he mentioned. It is
also the general pressure range for most plasma systems, which is
another way to describe a neon tube.

The other point was that was that even though the ending pressure is
higher, tubes are pumped down to a better vaccum before the neon or
whatever is added, to reduce impurities.

I have worked with tube-type pressure sensors for measuring vacuum,
which are essentially basic vacuum tubes where the efficiency is a
measure of the vacuum.

Get a pair of the personal radios that sell for around $ 50 or so a pair.
They have enough power to get that range from 100,000 feet and operate
about 460 mhz.FM.
It will not take much power at that height. I have talked to other hams in
airplanes that were at 40,000 feet and they were only using about 5 watts or
less.

Just like working on UHF and higher frequencies gets difficult because
of tight tolerances and tiny parts, small tubes are going to be more
difficult.

High power is something you want to be careful with until you know
what you are doing. As with anything homemade, you need to test
carefully before cranking it up. There's a reason they call them
KILL-ovolts and KILL-owatts.

But, is this gizmo going to stay up at that height? If the transmitter
is in part there for retrieving the gizmo, it drops down to earth and
you use direction finding to locate it, then the distance that comes with
that height above ground is lost. If it's just for in flight telemetry,
then your solution is fine. But there may be problems if it's there to
locate it after the crash or whatever.

However ,at 100 + watts ,with the J-pole antenna installed in a room , and
with humans present in that room ,prolonged RF exposure would NOT be
recommended. Check permissible exposure levels especially at VHF
frequencies.
Another potential problem with (high) RF power radiated indoors is
interference to other nearby electronic equipment.

As commercial transmitters go, I think those were pretty small ones.
Right now I've got a set of 4 Machlett water cooled tetrodes that each
weigh 130 lbs. They are rated at 175kW continuous each. We're using
them in pairs to make 2 push-pull pulsed amplifiers that will put out
over 2MW each for 50 milliseconds.

Just for comparison, each of these tubes takes 6kW of filament power.

And these are not nearly the largest power tubes available.

<snip>

Yes, I'm in the U.S. The information is GPS data for a high altitude
balloon project. The interfacing of the GPS module to the
microprocessor and the parsing of data from the GPS output is
straight-forward enough, however I'm just not sure about how to
transmit this data back to ground. :-) I think the simplest way
would be to include in the control program a routine to send a morse
code type beeping via 'the transmitter' indicating lat, long, and alt.
I'm sure there's better ways, but I'm still new to radio. :-)

Is it right to assume this home-blown technique is best suited to producing high power valves? Let's face it: the small signal tubes have very tiny internals not suitable for home replication. They're also dirt-cheap, in the main so not worth emulating. I recall around about 1980 I had the privelege of being shown around the BBC's World Service and saw some 50kW output tubes there. They were each the size of a soccer ball and the final PA used a bunch of 'em paralleled up to achieve the 1MW DC input power the station ran at typically. I'd have thought the enthusiastic amateur glass-blower would have a great deal of fun making up some of those.

Hi,

You could do a Google search with radio (NOT wireless)
and telemetry as the key words. This kind of stuff is old
hat - way back to WWII, so you should find plenty of
references. The gear that is used to track animal movements
may also be something like what you are looking for.

Cheers - Joe

Junkbox Surplus Parts for Sale as of 05/24/2003
===============================================

I have 200 excess pcs of 5.000 Mhz crystals. These are the miniture
crystals like you see in the latest QRP Quarterly. Tiny round
crystals with two wire leads, I think I've seen these in watches. If
we ever get 60m these could be a lot of fun.
50 for $4.00 shipped to the USA.

I have 400 pcs of 102J (1000pf) Shinyei ceramic caps rated at 630
VDC. These are in bags of 200.
$5.50 for 200 including USA shipping.

I have surplus 50K 1 Turn linear taper pots, about 25 each. These
are chassis mount pots with the nut. About the size of a nickle, and
about 1/2 inch deep with a 1/4 inch shaft about 1/2 inch long.
5 for $5.00 including USA shipping.

2.5/5.5mm Coaxial Power Jacks for PCB insertion or Manhattan install
10 for $2.50

285pf Green Square Plastic Cap, PC Board Insertion 10%
100 for $4.00

220pf 5% 63V SMD Caps - Surface Mount size is 0806
50 for $1.00 PLUS you must send a SASE for return.

Odd Items
============
9.8304 Mhz Crystals, 1/4 in tall - 20 for $5.00
27mH inductors with radial leads - 25 for $3.50

Caps - All new, old stock. No pulls.
====================================
All caps now 50/$3 or 100/$5
====================================
8pf NPO Ceramic - Loose
11pf NPO Ceramic - Loose
12pf NPO ceramics on tape
22pf Kemet Ceramic Caps, 200v, 10%
150pf ceramics, 100v, 10%
470pf Ceramics on paper tape, rated 5% (NPO)
560pf Kemet Ceramic Caps, 200v, 10%
1000pf blue mono caps, 10% 100v
3300pf Kemet Ceramic Caps, 100v, 10%
.01 uF ceramic caps, 10% 100v brand new by Kyocera
```

and
.01 uF ceramic caps, 20% 50v, new old stock, not used
50/2.50 100/$4

Voltage Regulators

I took a quick look at the voa.gov site.

A typical transmitter is 100,000 watts, although they use a great
variety on many different frequencies. With the right antenna design,
they are getting over 1,200,000 watts ERP in the direction they wish.

As a reference, WBZ 1030 AM broadcast in my area puts out 50,000 watts
on a clear channel at night and claims coverage of 38 states and
several provinces.

Commercial TV stations put out far more power, though. 600,000 to
1,000,000 watts is typical for larger stations.

Specifically http://www.arrl.org/hamradio.html gives all the details on getting started.

The current entry level license is Technician. It requires passing a 35 question multiple choice exam, but Morse Code is not required for this one. Their book "Now You're Talking" will help you learn the material and pass the test.

Other hams have done what you want to do, so it may well be worthwhile to find some of them.

I did the RF Exposure calculations and at 65W, its in compliance within
7 feet of the antenna (assuming a liberal 100% duty cycle and accounting
for ground reflections). Since I'm the only one in the room during
transmissions, and physically the closest person to it (I'm 13 feet
away), it should be fine. Take into mind 95% of the time I'm
transmitting on 5-10W, the RF exposure doesn't appear to be a major
concern.

As far as RFI goes, I've already tested various places in our apartment
for it and can't detect any serious problems. Our closest neighbors
haven't complained either.

Seems to be consensus from the sources I've asked that 65W into this
antenna should be safe under these conditions.

Another great website ! I also remember Ham Radio Mag had an article on an easy way to build a neutralizing cap good for a number of ham radio tx applications. Its in one of my dad's old HR mags (silent key WB8ETH). If I can find it, I will post it !.

The company Greg mentions also carried ROLLER INDUCTORS !!! :):):)

Thanks OM

Adam

3618. 6N7 good tube for a regen det ?

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-24 18:09:40 UTC
From: "A. Trent Phillips" <atrentphillipsnojunk@yahoo.com>
Message-ID: <EzOza.13622$rO.1237687@newsread1.prod.itd.earthlink.net>
Source record: 35325
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew

I am an SWL who has worked on tube rigs before. I have been inspired to build my own regenerative detector and have most of the parts. I was wondering if a 6N7 dual triode would make a good tube. I figured it would. I want to run the thing with 135 VDC on the plate. I am hoping to be able to work as high as the 16 meter broadcast band (just below 18 MHz), but even 19 metres would be quite nice (below 16 MHz).

So, 6N7, a good tube or not. I figured it seemed close to tubes used by hams before in similar apps including a VFO. It also looks to be a good rugged miltary metal tube in good supply (NOS US Army Signal Corps types are easily had for under $10)

In the end I wish to use an Octal based tube becuase it seems more authentic (an easier to work with, and I have parts around) and would like to keep the plate voltage around 90 - 135 VDC to keep battery and power supply configuration simple.

Thanks.

Adam

Or dangerous. I once pulled a pair of magnets out of a hard drive, they
were pretty small in size, and got my finger stuck between them. It wasn't
hurt, but it took a bit of effort to pry the magnets apart. The mind boggles
at the magnet you are describing.

I guess that's fine for *very* short broadcasts. :-)

>Just for comparison, each of these tubes takes 6kW of filament power.

Amazing!

>And these are not nearly the largest power tubes available.

Indeed. I wasn't trying to suggest the World Service tubes were
anything in that league. In fact it surprised me even at that time
that the station ran on such a modest power level, given what they
expected from it. I can't recall how much VoA puts out, but I'm sure
it dwarfs the WS by some order of magnitude. Anyone know?

The 6N7 is a relatively high-power tube. I don't know why you'd want a dual tube with a common cathode. I'd consider a 6J5. The 6SN7 is the dual version of the 6J5 and they were very widely used in early TV sets.

None of these types are at all "authentic" of the heyday of the regenerative detector. Regenerative detectors were long gone before the octal base was introduced. You'd have to go back to at least the 27 or 37. Or the 30 for low-power battery operation. IIRC, 135 V is much higher than the typical B+ supply used for regenerative detectors. Half that seems more familiar from my regen rcvr days.

I'm not an expert, but it's fundamentally the single frequency unless
you can tune the cavities (plural).

Er, yes... some parts are getting a bit dated as technology moves on,
but the fundamentals are still solid.

3630. Please help ID homemade tube tester

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-24 21:34:33 UTC
From: mcalhoun@ksu.edu
Message-ID: <baooh9$l5k@unix1.cc.ksu.edu>
Source record: 35335

Somewhere/when in my ancient past I acquired a homemade tube tester,
perhaps built from an ARRL (or other) construction article, which I'd
like to be able to use. If someone recognizes it from my description,
it'll save me a lot of trouble reverse-engineering the thing.

It is housed in a 12" x 8" x 3" high, 5-sided, Aluminum chassis and is
designed to be used flat with the open side down, the handle facing the
user, and the AC power cord coming out the "rear". Also on the handle-
side are red and black binding posts (perhaps for output to a meter?)
and the end of a lockable pot. Here is a rough picture:

```
|AC power cord <--- 12 inches --->
+----+---------------------------------------+ LEGEND
| PIN SET UP | ======
| TSa TSb TSc TSd Sw9 Sw5 Sw1 | "Sw" = 3-position switch:
| Sw10 Sw6 Sw2 | left is labeled "+"
| TSe TSf TSg TSh Sw11 Sw7 Sw3 | center s labeled off
| Sw12 Sw8 Sw4 | right is labeled "-"
| HTR PILOT | (By "labeled" I mean
| OK | "scratched onto chassis")
| |
| HEATER HEATER HEATER | HTR OK is a red-bezel lamp
| VOLTAGE 6AF6G TEST PIN PIN | PILOT is a yellow- " lamp
| SELECTOR EYE SWITCH SELECTOR SELECTOR |
| SWITCH TUBE SWITCH SWITCH | "TS" means "Tube Socket",
+-----------+-----------+----------+----------+ and the letters mean:
|| | | | a = funny 5-pin
|| | POT | b = funny 7-pin
One RED +----------------------+ c = (sub?) miniature 7-pin
& one BLACK HANDLE d = miniature (?) 9-pin
binding post e = octal
f = loctal
By "octal-looking" I mean the tube socket LOOKS g = 9-pin octal-looking
like an octal socket except for the pin count. h = 12-pin octal-looking
```

The HEATER VOLTAGE SELECTOR SWITCH has positions for 0 (also marked "off"),
1.5, 3, 5, 6, 9, 12, 16, and 24.

The TEST SWITCH has three positions marked HTR.IND., HRT.CAP.EL.CAP, and
GND.LK.CAP.

Both HEATER PIN SELECTOR SWITCHes have positions 1 through 12.

Beneath the chassis are:
* A 7-pin miniature tube with totally-obliterated markings (I'll put it
in the refrigerator later and see if I can "huff" some markings into

visibility)
* Two transformers:
* The umpteen-wire one goes to the HEATER VOLTAGE SELECTOR SWITCH,
so its function is obvious
* The other one is mounted so I can't count its wires, but two wires
go to what I suspect are the heater pins of the above-mentioned
tube, and another wire goes to a semiconductor diode in series
with a 100-ohm resistor and from the resistor to a 30-40 micro-
farad, 450-volt capacitor to ground, undoubtedly to provide DC
for the tube under test.
* The lockable potentiometer's marking don't tell me its resistance,
(but I can find out by unsoldering one lead)
* Six resistors (one may be a capacitor?) not mentioned earlier

The tester is VERY NEATLY wired, especially considering the large number
of wires connecting practically everything to everything else! I suspect
I can deduce how to use the tester, but I'd sure like to have some
operating instructions. If anyone recognizes the design and can cite its
source, I'll be VERY appreciative!

You can still get it at the RSGB, the title are "The VHF/UHF Handbook"
and it is a 2002 reprint. the ISBN number is: 1-872309-42-9 and the
price is £19.99 and £16.99 if you are a RSGB member.

Regards Max

Well if you are making your own, then you might only use a single filament
and two plates on either side. A magnetic field is used in the usual
configuration.

Connect an external tuned circuit to the two plates and tune to the
frequency
you want. I leave the design details for extra credit. You have to adjust
the voltage
and the magnetic field to match the frequency and also the spacing of the
plates.

Normal magnetrons use 6 or so internal cavities and there are tuneable units
that have
a tuning mechanism inside.

Good luck
Bill K7NOM

6SQ7 is an excellent tube for the purpose.

Oddly, the other day I stopped by a trash pile on the curb and pulled out a black crackle-finish box with some switches on it. When I took it apart it contained a 6N7, selenium, and plug in coil. There was no output to the circuit. I should have grid-dipped the coil but I just gave the whole thing away.

Hi all,

I'd like to buy a decently comprehensive book on practical UHF
transmitter/receiver design and construction, but there doesn't seem
to be any titles in the PW/RSGB bookshop, which is rather surprising
and disappointing. Would anyone care to suggest any titles that might
fit the bill?

thanks.

There's an ARRL book titled _The ARRL UHF/Microwave Experimenter's Manual_ that sounds like what you're looking for. Although it seems to contain a great deal of practical and useful information, I can't personally recommend it, since I've done very little amateur UHF experimentation. Perhaps someone who has made use of this book can comment on it.

What is wrong with the RSGB VHF UHF Manual edited by Jessop ?

From the ARRL, the UHF/Microwave project manual and the UHF/microwave
experimenter's manual are quite good.

Also the UHF Compendium by K. Weiner may be of interest.

However, since these books are 10-20 years old, it might be a better
idea to use PLL in frequency synthesis instead of long frequency
multiplier chains.

Hi Paul
Well nothing much is generally available although about
80% can be obtained from Maplin, its a very clever circuit
I thought and I've trawled a few!
Really for 160mtr and 80, VFO driver and twin PA for CW
but the really clever bit is the DSB it mods a transformer
connected to the screen grids of the twin PA to get the DSB
which I thought was very clever, I suppose about 10w Peak
6 valves EF80's ECC82's could be either EL84 or 6V6 PA
would make it look good (ï¿½2.95each on Maplin)
from Ron.....

As someone suggested the RSGB VHF UHF MANUAL (still in print?)
(The ARRL must havesomehting similar??)

Others..

VHF COMMUNICATIONS Magazine (A5 size) Look for Agent in GBR
Blue front cover
(still going?)

DUBUS Magazine (A5 size) look for Agent in GBR.
Green-ish front cover
(still going?)

Both of these have(had?) plenty of VHF/UHF/SHF stuff in them and
plenty of technical articles to build.

I cant remember how 'low'(freq) the RSGB Series MICROWAVE HANDBOOK
goes but might be something in there ?
Theres at least 3 volumes in this.

Try Jameco Electronics at:
http://www.jameco.com/cgi-bin/ncommerce3/ExecMacro/Jameco/searchResult.d2w/report?sort=BKW&search=2708

They have them listed as $4.95 each and have copies of the documentation on-line. They list them as "refurbished" and I have no idea what that means for an IC. How does one "refurbish" an IC??? ;)

Anyhow, good luck with your project!

1) The 'nipple' for tubes with a cap is under the cap, where the wire attatched to the inside of the cap comes out.
2) Maybe 30 +/- years ago, there was an article in one of the eloctronics magazines {Maybe "Electronics Illustrated" or Elementary Electronics} on an attempt to re-create the first vacuum tube made in Canada. The interesting aspect is that it didn't use a light bulb as an inspiration, but instead was modeled on a cartridge fuse!

Adam

A good regenerative detector should run with less than 45 volts on the plate. Even a low mu triode, such as a IH4 or 30 will often run with 12 to 16 volts B+.

The 6N7 would work, and I suspect almost any dual triode you find would also be satisfactory. The 19 dual triode was used in the Doerle TwinPlex--a Google search should give plenty of info.

Pete

From: funkbastler <funkbastler@eudoramail.com>
Message-ID: <l5t1dvkrdjfvi3l3of548rdc7un124emb8@4ax.com>
Source record: 35263

I have three solar panels, each of which will produce
about two (2) amps at 12 volts in full sun. I'd like
to use them to keep a 12-volt battery charged for my
2-meter transceiver, which draws 11 amps max during
transmit.

A couple of questions:

1. To connect the panels in parallel, should I use
a blocking diode on each panel with the diode outputs
connected, or tie all the panels together and just use
one diode? Either way, is any sort of equalizing resistor
advisable?

2. What's good for a cheap and easy charge controller?
I'm thinking about just using something based on a rather
generic (aka Ford) type automotive regulator.

I expect my transmit duty cycle to be something like 10
minutes every couple of days, so I have power to burn here.
So if I need to heat up some equalizing resistors, or waste
some power driving an electromechanical regulator or a relay
or two, it's not a big deal.

Thanks for your advise.

OK, folks, I'm fixing to move, and I need to 'donate' some boatanchor test gear. This equipment is in good working order. It was all used on my bench at one time or another, but has since been replaced and is too big/heavy/fragile/cheap to be worth hawking on the 'Bay.

READ CAREFULLY: The following WORKING equipment will be placed BEHIND the condo unit at 10126 NE 63rd Street in Kirkland, Washington (Seattle eastside) at 6 PM tonight (May 25, 2003). BRING YOUR TRUCK OR VAN. THIS IS HEAVY STUFF.

- Two Polarad klystron-based UHF/microwave signal generators, similar to http://www.users.bigpond.com/i.foster/images/Polarad-1296-1a.JPG. Both are clean and in excellent working condition. Coverage between them is approximately 800 MHz - 4 GHz continuous with FM and CW modulation. I believe I have at least one manual for these units (they're identical except for frequency coverage).

- One HP 8551B spectrum analyzer with two HP 851B display units, similar to http://www.fairradio.com/hp-851b.html. The 8551B and one of the 851Bs are very clean and in good working condition; the other 851B is in unknown condition. This includes the manuals and HP interconnect cable, but NOT the two BNC-BNC cables you'll need to connect the two units; these are easy to obtain just about anywhere. This is a really cool piece of gear that makes a very-serviceable spectrum analyzer for the 10 MHz - 12 GHz range. Its only drawback is the fact that it weighs about 100 pounds and takes up a lot of bench space.

- Maybe some more excess gear, too, depending on what I find in my storage unit. I dunno.

I don't care who picks this gear up, as long as it all finds a good home. IF IT'S STILL THERE TOMORROW MORNING, THE GARBAGE MAN GETS IT.

Again, READ CAREFULLY: I WILL NOT BE HOME. THE GEAR WILL NOT BE AVAILABLE BEFORE 6 PM. DO NOT CALL ME, EMAIL ME, OR OTHERWISE HASSLE ME REGARDING THIS OFFER.

ANY EMAIL I RECEIVE REGARDING THIS OFFER THAT SAYS ANYTHING OTHER THAN "Cool stuff! Thanks, dude!" WILL NOT BE ANSWERED.

I WILL NOT BE ABLE TO RESERVE ANY EQUIPMENT FOR ANY PARTICULAR PERSON, OR MEDIATE ANY DISPUTES BETWEEN PARTIES. :) To the victor go the

spoils!

A simple ion detector can be made from a neon bulb shunted with a 10 nF 100V capacitor. One side is connected to a small plate or other ion collector electrode, the other you earth out via your body (quite safe, the ion current is very low).

The bulb will blink every few seconds when the collector is held a few inches from the output needles. You can do the math and calibrate it if you like, but if all you want is a go/no-go test it will work fine just twisted together and held by one leg, with the other facing the needles.

If you can't get that close to the needles it should still count ions just more slowly with distance. The problem is that the leakage in the capacitor may exceed the ion current collected at large distances so there is no net storage in the capacitor and the voltage never rises above the neon ignition voltage. There is a fair bit of complex physics involved with the ion motion that I don't claim to understand, but a bigger collector and better earth makes it more sensitive.

For the generator the sharper the needles the better the ion production, but the corona generates a little ozone and, more importantly, nitrogen oxides, which combined with moisture make acids which blunt the point after many hours of service.

Use a separate diode for each. This keeps the whole thing from going
down if one panel fails. A schottky diode will increase the output
very slightly, at the expense of higher dark leakage. I suggest
1N5820, 3 amp, 20 volt with .45 volt drop at 3 amps and 2 ma reverse
leakage.

> 2. What's good for a cheap and easy charge controller?
> I'm thinking about just using something based on a rather
> generic (aka Ford) type automotive regulator.

Since the charge current is limited to 6 amps, a shunt regulator that
dumps up to 100 watts (6 amps times 13.8 volts) would not waste any
voltage during charging. You could make one of these with power
transistor or fet driving a lamp bank that draws about 6 amps max.
You would need a low power opamp and voltage reference to test the
battery voltage and adjust the load bank current to keep the voltage
from exceeding the batteries safe charging voltage.

Perhaps one panel is sufficient ot carry the average load.
This simplifies the voltage regulator by lowering its peak current
rating ot 2 amps. You should still have a blocking diode, though,
because the panel will absorb current in the dark.

Ahhh.... but then I have to go designing and building things ;-)

I kinda like the idea of using an automotive regulator (which are
series regulators, I think). That way, if it ever quits, I can
just replace the whole thing at virtually no, or at least very
little, cost. I understand that such a setup would either be
charging or not charging (i.e. no "charging just a little" if the
battery voltage is down just a bit), but considering battery
capacity and projected load, that's not a concern.

Is there any reason not to do it that way?

Back to mowing the grass (and weeds) here.....

In article <3mdvcvce5d6sv4on9vhpfqd91g8si24ibv@4ax.com>, Paul Burridge
<redscar@waitrose.notformail.com> writes:

>Is it feasible to build one for this sort of frequency? What would be
>the approximate dimensions? Anyone care to offer an educated guess?

Feasible? No. Dimensions? As someone suggested already,
scale a microwave oven maggie to a longer wavelength. Since
the magnetic field is also scaled, the magnet is going to be
huge. [magnetic field is an absolute necessity to set up the
electron spin inside the magnetron's simple diode structure]
You really DON'T want to work around such a large magnet.

But WHY?

Magnetrons were used wherever a HIGH power pulse of RF was
needed. Radar was ideal and I rather suspect that beginning
radar design was the impetus for the invention of the magnetron.
UHF range early radar used ring oscillators with several high
power conventional vacuum tubes...rather large structures, bulky,
not very efficient. Had about the same limited QSY capability of
the first magnetrons...not very good.

Amateur radio pulsed RF is rather limited throughout the world as
to peak output power. While pulse position modulation at around
8 KHz repetition rate might be good for a voice link using a rather
short pulse, it would be difficult to get any radio regulating agency
to approve it...required bandwidth would be rather wide. There are
other ways to achieve a much narrower bandwidth communications
link using lower RF power levels.

Harkening back to very early radar days, a single tube coaxial
line resonator oscillator can be built for maximum allowed
regulating agency RF power. I worked on such a system very
close to 500 MHz nearly four decades ago, requiring about 5 KW
RF peak pulse output. The double-line resonator structure was
larger than the average microwave oven's entire box...and that
doesn't include the power supply or the pulse forming network.

One of the early short-range small-boat radars of three decades
ago used modified radiosonde cavity triodes (Bonzer?). Much
lower power output but short ranges didn't need gobs of power.
Radiosonde cavity oscillator assemblies were cranked out at the
hundreds of thousands rate per year a while back.

Today or even two+ decades ago, smaller pulsed RF sources
could be made with Gunn diode assemblies, maybe with IMPATTs.

Those have a wider tuning bandwidth and are much smaller in size. Right now it would be much, much easier to stay with conventional cell site power amplifier structures using a pair of very high f-sub-t transistors...those can be scaled down from 1 to 0.5 GHz much easier than fussing with a very special maggie. You can parallel such amplifiers fairly easily with stripline combiners even at 500 MHz. Bandwidths of 5 to 10 percent.

If you want to have fun doing "mind constructions," I'd suggest a low-frequency TWT or Traveling Wave Tube. Those have an intrinsic octave bandwidth (guaranteed no-fuss QSYs) and don't need the humongous permanent magnet needed by magnetrons. Offhand, you might be able to make a TWT centered at 500 MHz about 2 feet long...provided you have about a dozen other skills plus vacuum pump and specialized metal-glass-working equipment.

Nah, it tops out at about +10 dBm.

The backward-wave oscillator tube in the HP 8551B probably generates
more power. I used it as a 2-4 GHz (er, Gc) signal source before I got
the Polarad generators.

Evidence. People are getting wiser. I have seen a lot of moving around here (#1053, etc). A lot of people seem to be carrying backpacks with multiple pockets, etc. and also other square bags, etc. Many of the devices seem to be quite compact and portable. The older heavier and bigger items are a dead giveaway and pose an exposure risk and possible liability. These Taiwanese and US Chinese etc seem to be working with computerized compact devices built into cars, microwave ovens, rice cooker type of devices, etc. Looks like Seattle and some others here are a liitle behind in the miniaturization.

I'd expect the tube to work fine. The common-cathode dual-triode
regen is a venerable design.
>

There were certainly many, many octal regens made for ham and SWL use,
homebrew and commercial. I wouldn't be surprised if there were more
octal regens than any other tube type (think of all those basic radio
plans and kits from the late '30s through the '50s).

BTW, you'll probably only need about 30V on the detector plate.

3674. Re: Solar panels / charge controller

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-25 22:29:56 UTC
From: Roy Lewallen <w7el@eznec.com>
Message-ID: <vd2gur4m7c2r2d@corp.supernews.com>
Source record: 35278

A typical auto regulator adjusts the alternator field current to control the battery voltage. Depending on the regulator design, it might work pretty much as-is. Old-style mechanical regulators typically had three charge rates -- no charge, where the field was connected to ground; medium charge (relay moving contact not touching either fixed contact), where the field was connected to the ignition line via a series resistor or resistive divider (usually a nichrome wire resistor wound on mica and riveted to the underside of the regulator); and full charge, where the field was connected directly to the ignition line. Intermediate values were obtained by chattering of the relay, which could create a great deal of radio noise. I haven't looked into modern solid-state ones (now often integral to the alternator), but I imagine that some of them are proportional while others might switch. You might need to do some filtering of a switching type to keep the QRN down.

But stability can be a problem, because a solar panel acts like a pretty constant current source, while most other commonly regulated sources are basically constant voltage sources. A large capacitor across the solar panel will sometimes provide a solution if this is a problem. A shunt regulator is a very simple and effective way to do the regulating, although you end up having to dump a lot of power when the battery isn't charging at a high rate. I've gotten by with a simple 3-terminal series regulator. If you're intending to float the batteries, though, you might need to do some sort of adjustment of the charge voltage with temperature to get the maximum battery life.

Provided all three panels are of the same type and are located in the same sun exposure you can simply parallel them and use one diode to prevent the battery from discharging into them when in the dark. No need for equalizing resistors because the panels are current limited.

I would look for a charge controller designed for use with solar panels rather than trying to use an automotive regulator. You'll find a bunch of them with an Internet search. You might also look at http://www.seslogic.com/microm.html for some inexpensive controllers. Series controllers develop less heat than parallel controllers but you have to be careful that they do not generate RFI that might get into your receiver (many of the series mode units utilize switch mode power supplies to generate the gate voltage for the switch FETs - the Mico-M does not).

I remember the scrappers used to mark IC's rfe (removed from equipment), I have never seen anything marked refurbished. I still have some in working equipment, so until they break the parts won't be available from me.
thanks, John.

Electronic Goldmine has a solar charger that will handle up to 150W of charging. http://sales.goldmine-elec.com/prodinfo.asp?prodid=6132 at only $8.95 US. I have one in use right now, and it works beautifully on my system. Goldmine gives you everything you need to hook it up and adjust it to your solar panel and battery pack. Good deal.

I second this suggestion. I also have one and it works just fine. I've seen these on Ebay for about $30 so this is a good deal.

Usual disclaimer...no connection except as a paying customer....

> What advantage would that offer, Bill?

A klystron would be easier to build, especially for 500 MHz. It is built
so as the electrons flow in a straight line. The electron beam goes
through two cavities.
One is the input and the other is the output. If you couple these together
you get an
oscillator. Or you can make a reflect oscillator where the beam goes
through one cavity
Is reversed by a high negative voltage on a "repeller" electrode and the
goes through the cavity
in the reverse direction.

Cavity sizes and voltages can be selected for whatever frequency you want.

An automotive regulator uses considerable power at all times it is in
operation (even when it is dark, in this case). Their design is not
concerned with wasted power.

A three terminal voltage regulator chip might do the job, and these
are available in multi amp versions (up to 5 amps, I think) but they
waste 2 or 3 volts so you will get reduced output from your solar
cells.

3693. Looking for a Datasheet of a 7x7x9mm IF-LC-Filter

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-26 05:49:02 UTC
From: Markus Wolfgart <xx_markus.wolfgart@dlr.de>
Message-ID: <3ED1AACE.5010003@dlr.de>
Source record: 35296

Hi NG,

I'm looking for info's concerning a small IF-LC
filter probably for 10,7MHz labeled with three
color points red, black, pink and the number
99059. The small ceramic condensator has a value
of 80pF and the inductor on this side a value of
3uH. The opposite placed inductor has a value
of 30uH. The filter has five pins and four of these
pins are used.
All inductors (all pins) are dc coupled and the
measured maximum resistance is about 6 ohms.

What for my looks a bit funny is the way like
the inductor is wounded on the body, have never
seen such winding technique before.

Would be nice if You could point my to a link
where to get some detailed info's about these filter
or give me some explanations on this kind
of filter/diskriminator or what else it could be.

Many thanks in advance

Markus

I assume you mean how to draw an outline for a piece you'd cut from
flat stock so that N of those pieces stitched together along the edges
would form a parabolic reflector. Shouldn't be difficult to derive.
Did you want it for a particular N or more generalized? Did you want
it for a specific diameter-to-focal length ratio, or generalized? The
biggest difficulty I see is that if each petal has only simple
curvature and not compound, you'd want to adjust the edges so as to
minimize the error in some way, since the result won't be a perfect
paraboloid. With large enough N, that wouldn't matter.

Cheers,
Tom

==========
FYI ,I have the RSGB VHF/UHF Manual by George Jessop . G6JP 'SK' ,4th edition ,reprinted 1992.

In the mid 90s RSGB sold it off cheaply ,due to publication of a new manual.

The 4th edition includes both valve and semiconductor designs ,perhaps not involving up to date technology ,but still very useful for radio amateurs and as such still a treasure.

Hi all,
20 years ago I had an opportunity to see the inside of a 750 000 watt medium wave AM transmitter. In the modulator and PA there were together five water cooled triodes, about 130 cm high copper-and-glass beasts. The pipes (hundreds of litres of distilled water inside) and coils made of thick silver-coated tubing were simply amazing. BTW, the manufacturer recommended to use two such transmitters via a combiner on one antenna, i.e. 1,5 megawatt of continous RF power...

> some power driving an electromechanical regulator or a relay
> or two, it's not a big deal.
==========
On the assumtion you are charging Lead-Acid leisure (deep cycle) batteries :
1) Solar Panels usually have a reverse blocking diode included . If not fit
1 diode in series with each panel .

2) Depending on the nominal panel voltage output you might not need a charge
regulator ,meaning that at full sunlight the output voltage might not get
above 13.8 V (or 13.5 V when using sealed batteries) .
Note : I am using solar panels with a nominal full output voltage of 16
Volt., hence a charge controller is required.
Also because I run the system in conjunction with a wind generator , I have
made a charge controller which limits the battery voltage to 13.8V.
This is done with an opamp used as a comparator with the inverted input
pegged to a zener voltage and the non-inverted input sensing a fraction of
the battery voltage . The opamp is driving a transistor which in turn
drives a number of power transistors . The load is based on a number of 12 V
car bulbs .
Any current generated which tends to increase battery voltage above 13.8 V
is dumped through the car bulbs.
Voltage control is +/- 20 mV.
A simple but effective system.
Please note the controller does not adjust charge voltage with changing
temperature, although this would optimise battery life.

Hi all,
I 'm trying to repair an 8482A. I've removed the sensor assy and am trying to slide the substrate out of the cylinder, however it is held in place by 4 pins. These don't appear to be a hex key or other tamper proof tool, they appear to be press fit.

Any one provide some hints on getting these out so I can remove the substrate?

Thanks in advance

I want to build a homebrew 2m SSB/CW (possibly AM as well) Rx, that I will use with my xtal controlled 2m TX.

Anybody any info on circuits, or know if there are any commercial or surplus boards out there I could make an rx with. I'm wanting to have different bandwith for the modes.

(Or, perhaps I could use an old Eddystone RX. (What was the model that covered VHF I think to myself out loud)).

I do have a MM 144/28 Mhz converter.

Rich.

Trouble is, I'm no mathematician :(

Yup, want to calculate the outline for cut outs from a flat sheet.

Needs to be able to deal with different F/D ratios along with being able to deal with differing number of petals.

A simple curvature for each petal is fine (so long as it's parabolic), not having a compound shape is ok, so long as I use enough petals the error won't make to much of a difference.

All I need to find is the formula, I'll then write a windows program to print out the shape and/or dimensions.

Have looked for ages on the net without success.

Clive

Source record: 35209

A way I'd use is to put together an efficient switched mode regulator (80% shouldn't be hard these days what with the available chips/fets around), one that can deal with lower than battery voltage input voltage - ie, to step up the solar panel output voltage to the required constant charge voltage needed by the lead acid batteries - or if their nicad then to provide enough voltage to constant current charge them.

If the solar panel voltage goes above battery voltage then switch to a 2nd regulator circuit (step down for lead acid, or simple constant current for nicad).

If you have plenty of spare power but the voltage is not quite enough, then simply wire 2 panels in series and use a simple step down regulator or constant current source.

Forgive me, but that isn't a totally accurate summary of the aims and contents of the book; and I wouldn't want other newsgroup readers to gain the wrong impression.

VHF/UHF DXing involves both technical *and* operating knowledge, and the book was written to meet that specific need.

After the general introduction, only two of the remaining 11 chapters are purely concerned with "operating and stuff". Another is about antennas, but all the rest are largely about "practical circuits and projects" and/or about understanding how they work.

If that mix of contents doesn't meet anyone's particular needs, then of course that's OK by me.

Picking up Roy's point about the ARRL VHF/UHF/Microwave Experimenter's Manual, that is a compilation of one-off articles and conference papers which are mostly technical background. There are very few projects in that book. However, there are now two companion Projects manuals, assembled in the same way. These compilation books probably represent the opposite approach to my own, in that they don't have any central theme.

As a result, most serious VHF/UHF/microwave experimenters end up with every book that's ever been published in the amateur press, plus a few professional books like Bowick's... and find each one of them useful in its own individual way.

It's possible that a blocking diode is already in the panel assemblies. You might have the info in the panel documentation or it's possible you may be able to see it near the output terminals.
Most solar arrys I'm familiar with actually are diodes, but very leaky with reverse voltage. To prevent them from draining the battery when dark, a "good" diode is usually in circuit as part of the assembly.
I'm not sure what you want to equalize, but no resistor is needed.

Now THAT is the ultimate insult!

Designing is not a problem, cuz I can still find a pencil
and some paper, but building *is* a problem. Haven't seen
the surface of my work bench in several months - way too much
junk piled up on it, too lazy to clean it off ;-)

73,
Jim - WA5RRH

Thanks for all the ideas and info - looks like the Ford
regulator is not the way to go.

Have ordered one of the controllers from Electronic Goldmine.
Looks like a cheap, simple solution to the problem.

Do you have a LOT of experience with buiding?

Might I suggest finding some older VHF equipment and tinkering with that? VHF
ciruits get mighty sensitive for those attempting to build their own.

This is a man who has posted abuses against me as well as conspiracy to commit murder, etc.

He is posting from London/UK which he thinks is a safe haven for hate-mongers / terrorists like himself.

He is probably funded by Church sources (religious faith funding type) or secret organizations run by Church sources or such kooks. He has posted lies and attacks pretty routinely.

It is time to bring such people to book for the crimes that they are committing without batting an eyelid.

Those guys builder Pin removed the antenna after several complaints and lots of injuries over a long period of time and basically not allowing me into my bedroom without being burnt.

However, even though the claim is they have done what they could, another party ADT probably came in and installed another internal radar system with a horn under a missing top tile and also the chimney metal top. They continued the burning almost seamlessly while pretending to have stopped it ! It appears to be controlled by the Fire guys because I have seen them pay their respects every time they come nearby. The house is being rented and had several residents - 'white' young couple, latino, German, India-n/Pakistani now, etc. Quite obviously kook-house. The kooks control every square inch around here and can hypnoptise you and put you to sleep (with radiation beams, etc.) within a few seconds no matter where you are in this whole area. Outside the area, there are other means that can do the same thing. From there to instant death is only a small step ie. anyone can be killed at any time with the existing built up infrastructures which are continuing to be refined every day with the latest modulation and polarization etc. to escape detection. A vision of hell that no one seems to be aware of (even the kooks do not know most of it - they just run one instrument as told or allow their homes to be retrofitted with the killing/injuring/torture equipment, etc.) even aware of right around you.

Check out this site for ultra simple charge controller. A 2 hr max. project..... It works. I have used it for a couple of quick and dirty apps. The Red Rock Shunt2 design is even better but may take and afternoon or evening to put together. The Red Rock has lots of fascinating solar apps including using LEDs as light sensors. And they are definitely a DIY outfit.

Cheers,

Z

Right- you're probably already on a disability, and that's why you have
so much free time on your hands. Isn't there something you can do to
spice up your same old tired crap about radiation burns? You're getting
quite boring.

3732. Crystal radio variation

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-26 17:54:18 UTC
From: Alex <ve3leg@hotmail.com>
Message-ID: <3ED254CA.9020009@hotmail.com>
Source record: 35235

I built a simple crystal radio over the weekend, and used an interesting alternative to the oldstyle high impedance headphones. I used a 500 ohm impedance CB microphone and an 8ohm/1000ohm RS transformer, and I got output. Faint, but there. In a quiet room if I listened carefully I could hear a basketball game on the local AM sports station. Any ideas for improving this, or sources for real high impedance speakers?

Try hooking up a set of walkman headphones to the low Z side of the
transformer, with the heaphones wired in series. This should appear as
about 16K on the high Z side of the transformer.Wiring the headphones in
parallel should give you about 4k on the high Z side.

Use a blocking diode on each. Odds are the panels are not perfectly matched. I fooled around with SMALL scale photovoltaic cells some years ago and if one panel has a slightly ower voltage, you get problems. In your application, you can get real problems. I would just have one diode (heavy silicone rectifier type) on the positive (+) side of each cell. That way current goes from each cell to the battery / controler and NO OTHER WAY. Better safe tha sorry.

I also do not think the Ford Voltage regulator will do much good- it's made to send a signal back to the field coil of the alternator. I wish I could suggest a good controler. If I run into a good one in my books, I will post it here.

I was wondering what kind of battery you where going to use. I would say a car battery is a BAD idea. Car batteries are NOT made to be deep cycled. A few charge / discharge cycles could ruin it. Have you

considered a Marine battery- AC DELCO makes a number of large Marine Batteries with a high capacity and DESIGNED with deep cycling in mind. Any Murrays auto parts carries them and they could be able to look up a charge rate for you. If need be, I have a complete set of books here on car parts (I used to work for murrays and got the whole set when they threw out the old ones)- including the AC-Delco Marine Battery book.

I'd suggest using an old multimode CB (eg Cobra 148) with the 28MHz down converter. Then replace the VFO from the CB with a more suitable continuous tuning one. There is ,loads of info around on the net for pulling the Cobra up to 28MHz. Rip out as much of the TX strip as you can and dump the casings and front panel if regulation forbid the ownership of such a set in your country - something that could obviously not be made to transmit is not going to provoke a reaction from them.

That way all the Rx amplification, product detection et al is done. You'll have a working project off the ground quite quickly. Then you can replace successive parts of the circuitry of the old CB rig as and when you are able. Despite appearances most of the old multimode CB sets are quite logically laid out with all the RF strip together, all the VFO together etc. This lends itself nicely to the units being split into modules.

You will of course want to build a 28MHz first IF unit to reclaim your down-converter first.

Is this similar to the VHF/UHF DX book as mentioned elsewhere on this
thread? I've checked out the contents of this and it seems a bit
overly concerned with propagation and stuff, whearas I was more
interested in seeing a decent range of practical circuits and
projects.

Building crystal radioes is a lot of fun, I build my first 40 years ago and
they
still ameces me. Finding a real high impedance speaker is not easy, but
build your own, there is a great instruction on how to do it here

http://www.peeblesoriginals.com/crystal-loud-speaker.html

Btw. there is tons og stuff about crystal radios on the internet, quite at
big hobby these days.

Rich,

I don't know what you mean by "old" Eddistone, but the one I had occasion to use was from 195X, covered VHF, some UHF, beatifully made, and performed like a monumental POS. Had trouble picking up an FM station from 5 miles away. Don't recall if it would work on CW and SSB. Downconverter and HF radio sounds like a good way to save money.

I have 4 electronics benches around the basement. It is often easier to build than clean. Besides cleaning off a work bench often leads to traumatic mental anguish... what to keep-what to throw away; leading to a brain freeze up where nothing gets done.....

Cheers,
Z

Just about ANY triode (or pentode for that matter) will work fine
in a regen detector. Triodes usually work best with only 20-45 volts on the
plate, for pentodes make that on the screen grid. There is nothing
wrong with
using a higer plate SUPPLY voltage, just use a resistive plate load (50k
to 220K) and
adjust this value so you end up with somewhere betweeen 20 - 40 volts on
the PLATE.
The 6N7 is both a power tube and a high mu tube, but nothing wrong with
that.
Go to www.lindsaybks.com and look for his book on the twinplex regen
receiver.
This circuit uses a type 19 battery tube, but he shows a version using a
6SL7 tube that will
work fine with the 6N7.

Yes, I'm sorry for the rather inaccurate synopsis, Ian. I'm sure it's
an excellent book for the majority of people who wish to try their
hand at DX on the higher frequency bands.
The other problem I face in selecting a suitable tome for my own
rather specific needs is the inabiltiy to flick through any possible
contenders. That's a major snag and one reason why I rarely resort to
mail order for books.

3746. Re: (mildly OT) Anyone got three 2708 or MCM2708 EPROMS?

Programming 2708 is a little tricky now-a-days with newer programmers. These
old chips needed other voltages to program with, something like +21 or +25
volts if I remember correctly, plus a negative voltage. If you can find a
2758 instead, it is pin equivalent to 2708 but is programable with more of
the modern programmers out there (+12V I think, it has been a while).
I remember those 2708s from the old days of Altair computers, along with
those 17xx eproms....hi hi
Good luck

As well as the multiple voltages, the programming was different. Each address
needed about 50ms programming time, but you could only hit each location with
about a 1ms pulse. And you couldn't just hit that location 50 times in
sucession, but had to go around ALL the addresses 50 times. But if you want a
REALLY complicated programming method, then the even earlier 1702's were
hard to beat!

Beats me who it would be. The electronic surplus market in the Seattle area is nothing short of wretched. We have one decent component seller (RADAR Inc. in Bothell) and one high-priced, understocked, but nevertheless appreciated outlet (Vetco in Bellevue).

At any rate, I'm really not interested in hauling the HP 8551B analyzer around, but I was also totally bluffing when I threatened to let the garbage man have it. :) It is one of the most beautiful pieces of engineering I've ever seen, rivalling any of the great Tektronix instruments. The trouble is, although I used it quite a bit back in the early 90s, I've hauled it through my last three moves without even powering it up. That means it's time to pass it to someone who can actually use it. RADAR Inc. wouldn't be an appropriate venue, and Vetco would park it in a corner for the next twenty years with a $1,000 tag on it.

I was surprised, and more than a little bummed, when it sat out overnight after I cross-posted a "FREE!" notice to four newsgroups and three mailing lists. It's now been dragged back inside and promised to a fellow from Portland who emailed me this morning asking about it.

As for the Polarad generators, they're fine where they're at, sitting out in the rain behind my condo. I bought them NOS for $100 apiece several years ago. They're good if you need a drifty, noisy, unlevelled signal, but there are plenty of better (and lighter) alternatives available nowadays for very little money. Unlike the 8551B, I wouldn't lose any sleep over them.

Hi, you wrote:
> Radar was ideal and I rather suspect that beginning
> radar design was the impetus for the invention of the magnetron.

Not so. The magnetron (in its original form) was invented by Augustin
ï¿½ï¿½ček, professor of the Charles University in Prague, some eighty
years ago. Radiolocation was developed later, mainly during WWII.

Hi Namaste,
thanks for the link, I already have the manual - the issue with it is that
it treats the A1 assembly as a replaceable unit and does not describe any
repair / disassembly processes for it.
Thanks
Greg

Hi Rich,
What you ask could be very simple. 70MHz is a standard overtone crystal frequency, something like http://w1.859.telia.com/~u85920178/rx/zn414-m1.gif but with slightly different coils in the oscillator - oscillates at 70MHz and outputs 140MHz.

Stuff this into a simple dual-gate FET, with antenna, just like TR2 in http://w1.859.telia.com/~u85920178/rx/tba120-rx-cct1.gif and you have made a 144MHz to 4MHz converter.

Now make your receiver for 4MHz to 5MHz = 144MHz to 145MHz.

http://w1.859.telia.com/~u85920178/rx/reflex_rx.htm is a cheap and simple AM receiver.
http://w1.859.telia.com/~u85920178/rx/quickrx.htm is an even simple SSB/CW receiver.
http://w1.859.telia.com/~u85920178/rx/regenrx.htm is also easy, but a little "fiddley" witht he coils.
http://w1.859.telia.com/~u85920178/rx/regen2.htm are more sensitive receivers.

If you like valves then why not consider
http://w1.859.telia.com/~u85920178/rx/cigarrx.htm or even
http://w1.859.telia.com/~u85920178/rx/tube-rx.htm

Yea! I know I am plugging my homepages
(http://w1.859.telia.com/~u85920178/) but I believe I am giving you a bit of good info.

You can still get the old HiZ headphones from http://www.tubesandmore.com
and they are just like the old "Brown Bros." you used to get in the 50's.
They do feel a bit "plastic-like" but they work and they even poach your
ears with sweat, just like the originals did.

I never thought about using a CB radio as the tuneable IF, but I think
that could be the way to go. I'd probably have to alter the filter so
that it selectivity was suitable for the mode, and add a BFO obviously.

I think I might make another post on converting CB radios and see what
happens.

Rich.

3755. Using modified CB radios as 28 Mhz tuneable IF's.

Hi.

I'm wanting to make a 2 meter SSB/CW (and possibly AM) RX. I have a MM 144/28 Mhz converter.

It's been suggested that for a 28 Mhx tuneable IF I could quite reasonably buy a CB radio and modify it.

Cobra 148 has been mooted as a possibility.

Any know of any other CB radios that make good modification projects?

I'm in UK by the way (If that makes a difference).

TIA.

Rich.

The only problem I see with the idea is that CB radios are channelized with a channel spacing of generally 10 KHz, so I wouldn't really consider it a "tunable IF". You will only be able to receive 40 discreet frequencies +/- some control if the rig has RIT. Now, on the other hand, if you intend to add a VFO to the CB rig, it should be OK. That seems like it would be a fair amount of work. If you have an HF rig, why not use it as the IF? If it's a general coverage HF radio, you can receive the entire 2M band. If transmit is the problem, most modern solid state rigs can be modified to transmit "out of band" so that you could transmit on the entire 2M band as well.

i would suggest finding a radio shack HTX 100 or HTX10 both are 10 meter
monile radios that you can pick up used for under $100 and you could
easily spend that much finding the right CB and getting it converted
also you should consider just buying a used older 2 meter all mode rig
like the kenwood TS700 which you can pick up for around $100 or more
depending on condition or the kenwood TM9000 is a 2 meter all mode
mobile radio that could he had cheap as well
good luck

Good for you! for making the effort to connect someone with real
electronics. If you keep on trying, eventually you'll get some
hits, and somebody who didn't even know what 'signal' really means
will get interested.

I learned more from scrounged stuff when I was a kid than I have
from lots of equipment I bought later.

The Chicken Banders (CBr's) have what they call a "slider", it's a vfo
to make them continious tunning. Check around (carefully) with some
truck drivers they can probably point you in the right direction.

• the trouble with TV HV supplies is that they are not designed to have continuously adjustable output potential. Thus, a neon sign transformer powered by a variac is more versatile.

And, since the sun is going byebye for a few years
Radio Shack is getting out of the ten meter
business. The radios are being sold at $49.95.
That is not a lot of money, and the equipment is
"type accepted" for the intended purpose.

In addition to the other comments:

Depending on your location, the hi-power, hi-splatter bleed-through
from marble-mouthed CB `operators` with ampliofiers may make your
life miserable.

Gee, John, I didn't realize you were a "neighbor." And I was really hoping that you would have gotten a better response to this. I have some equipment that I really should get rid of too, and would like to find some decent homes for it. Some boatanchor type components, too...things like iron-core power transformers that I'd hate to just toss. No big plate transformers (other than one that's too high a voltage for most tubes), but quite a few lower-voltage things in the few VA up to perhaps around 300VA. But if you can't even get rid of nice test equipment, maybe it is time to start dumping. :-(

Cheers,
Tom

However, as far as I know, the trick to making _high_power_output_
magnetrons came from the Brits at the beginning of WWII. See Robert
Buderi, "The Invention That Changed the World," ISBN 0-684-81021-2.
The high pulsed power output is clearly critical to practical radar
systems in those days. Certainly there was a lot of interest about
that time in finding ways to generate high power UHF pulses, and
finding ways to detect small signals at those frequencies.

Cheers,
Tom

Well, in all fairness, maybe I shouldn't have expected instant
gratification from an ad posted six hours in advance of the 'deadline.'
Usenet isn't an instant-messaging medium, after all. Plenty of people
expressed interest, albeit from New York and New Zealand!

I've been playing with the 8551/851 for the past several hours; it's
amazing how well it works for something from the early-Apollo era. The
filament-voltage regulation is pretty crappy thanks to some germanium
transistors I never got around to replacing, but the electrolytics seem
to be holding up well and the exotic parts (BWO, IF cavity amplifier,
front-end mixer, CRT) are all still within or better than spec. It's
still got a couple of decades' worth of life in it, I think. Certainly
a much-better spectrum analyzer than the ones people are building with
CATV tuners and the like.

It's a shame we couldn't obtain a few "surplus" HARM missles to send the
Chicken Banders way.

I've got one of these modulation analyzers that has problems and I'm wondering what use besides the counter and power meter function it might have in ham radio. I thought it had a tracking generator but from what I can tell it doesn't so it can't be signal generator but I 'm guessing it has the capability of being a receiver of sorts. Any ideas or a help with a manual appreciated.
tnx

The 84XX series of sensors were never designed to be repaired. If they fail, Agilent just charge for replacement. Even if you do get the substrate out, I doubt if you will be able to get the replacement diode for it.

I am sorry to put a downer on you, but I suspect you are wasying your time.

Many years ago I had a 12-V, 200 watt WindCharger with no built-in way
to control the charging current, so I built a shunt regulator to "dump"
excess current into two 100-watt one-ohm resistors. The total design
(hack?) ran my ham shack for 15 years (until trees grew taller than the
generator's support pole!) Maybe this ASCII schematic will get thru OK:

```
+ -----+-------+----------------------+-------------+----------+
FROM | | | | |
W R 5Kohm | R 0.13ohm 10W R each |
I | pot | | | |
N | R 200 +-----+--------)-------+ | |
D | | ohm | | | | | +|
C | | | R4.7Kohm | 5watt R each | ~12-volt
H | | | | | | | auto
A +---+ | b |c | b |c | b |c battery
R | | +------GE69A +------2N2082 +---2N2082 -|
G | | | |e |e |e |
E 820 R +---TL431 | 1ohm R 1ohm R |
R ohm | | | 100W | 100W | |
- -----+-------+--------+-------------+-------------+----------+
```

The left-most three resistors are 1/2 watt;
the TL431 is an "adjustable zener".

Assuming it is similar to the 8902, it is pretty useful for FM deviation checking. You can use it as a receiver of sorts but IIRC, it has no AGC.

Message-ID: <3200347.0305271527.caf6795@posting.google.com>
Source record: 35177

As with many such inventions, the history seems a bit clouded. I did
a search for the inventor of the magnetron, and all roads lead back to
about 1920, but to various people, including an American, Albert Hull,
a German, Habann, and also to Augustin or August Zacek. I think it's
more important that all of these gentlemen (and many others working in
related areas) made contributions to the early development of the
magnetron, than to worry about if there was really just one inventor.

Cheers,
Tom

The 2758 is really nothing more than a 2716 that is half bad. You
program half
of a 2716 (upper or lower depending on what the A10 pin is tied to, high
or low).

You've got a problem -- the A1 unit (thermocouples plus diode) are not
what's considered a user-serviceable item. The service manual gives a
hint at this when it talkes about tweaking performance by varying the
position of the wires from A1 to the interface board.

If you've popped a thermocouple, which is all too damn easy, save the
spare parts and start hunting for another unit. Th.ey turn up on eBay
all the time.

Good luck!

>reasonably buy a CB radio and modify it.
>
>Cobra 148 has been mooted as a possibility.

ok choice but, only for am. To add SSB/CW would take a lot of
work that could be more easily done from the ground up.

Many CB radios are not good candidates, the better choices
would be any of the am/ssb radios with UNIDEN made boards.

This is a better choice if your using a CB as foundation would be a
AM/SSB radio as it's already capable of AM, SSB and CW.
Then you only need to modify the PLL or outr right replace it
with a VFO (or crystal osc mixed with a VFO).

I've done this with older (those that did 23ch) AM/SSB radios
and they are easier to work with. My current 6m SSB radio is
an old (Ca1972) Midland 13-849!

If building is new to you I'd strongly suggest considering a kit.
An Elecraft K2 makes a very good IF radio and it covers 10m.

if you have large HV transformers to dispose of, search out the tesla coil groups - there is a tesla list that is quite active (it's a closed list, but not that hard to find) - a 10 to 30 KV transformer at a few hundred MA would make a coiler quite happy.

==========
True. The final touches to the first 3,000 megacycles cavity magnetron, 50 KW peak power output, 1 micro-second pulse-width, pulse repetition frequency 400 c/s per second, were made by the inventors Randall and Boot in a top-secret laboratory at Birmingham University during the air-raids on that city and on nearby Coventry. The modulators and other novel devices also had to be developed. R & B had begun with the 2-anode low-power cw magnetron which had been available perhaps for 15 years but nobody had ever made any use of it.

At the time I lived a few miles from the university and worked at a factory making drive-motors and selsyns without knowledge of their ultimate destinations until later I joined the RAF on radar mantenance and recognised and flew with some of my previous products. The receiver's detector was a tiny cat's whisker pressing against some metal whose name I've forgotten.

Churchill himself ordered the magnetron not to be used in raids over Europe until 1000-bombers a night could be deployed. This was to prevent the secret falling into German hands who, at the time, had a preponderance of aircraft. He gave the first of the magnetrons to Roosevelt and the Americans, who with their far greater industrial capacity proceeded with mass-production. Later on the Americans developed a 10,000 megacycle version which allowed narrower beam-widths with smaller dishes and greater navigating precision. R & B's first working model of the cavity magnetron is in the London Science Museum, Kensington. The last time I saw it it was all by itself in a locked glass case. The first time I held one in my hands was in 1944.

(Incidentally, one cloudy night when 1000 bombers were over western Europe navigating by Gee (Loran), the Germans, who had figured out how it worked, suddenly switched on many jammers and 110 aircraft failed to return to base. Most were shot down or crash-landed. Many landed in Scandinavia, Russia and north Africa. Loss of aircrew alone was a great disaster.
==========
>
> You're right, Tom. Codenamed 'HS2' the earliest airbourne radar
> systems were pioneered by the Royal Air Force's Pathfinder squadron.

==========
Actually the codename was H2S or hydrogen-sulphide which has an abominable stink. Until the Pathfinders with H2S (there was also shorter-ranging Oboe) most bombs dropped at night by the RAF had killed cows in the fields miles from the intended targets. Whereas night bombing of British cities was

fairly accurate as I have myself witnessed. Industrial areas were chosen rather than residential. I understand German bombers were guided by following cw radio beams. Coventry city centre once alight provided its own beacon and on the same night a greater wieght of bombs fell on Birmingham.

The RAF had airborne radars at the begining of the war. The codename was ASV (Air-Sea-Vector) Mk1 and Mk2, which operated on 176 MHz with a multi-element yagi on each side of the nose of the aircraft. These radars were installed on long-distance flying boats such as American Catalinas and 4-engined Sunderlands and were engaged in convoy escort duties in the Atlantic and in the Indian Ocean.

The H2S scanner (dish) was usually installed under the nose of a bomber enclosed in a perspex radome. However this was not possible with flying boats and two scanners were employed, one under each wing tip. The hull or belly of a Sunderland was an obstruction and it was necessary to synchronise the rotation of the two scanners, one covering the portside 180-degrees and the other the starboard side. The scanners rotated at about one cycle every two seconds which also had to be exactly sychronised with the operator's PPI (Plan-Position-Indicator, a crt). There was also a means of measuring height above sea or ground level. The first echo to be received following each pulse obviously comes from the ground.

The scanners were fed via waveguides running inside each wing. In dead centre of the aircraft was a waveguide change-over switch which had to be mounted on the floor of the gangway on the top deck not very far behind the captain and co-captain (remember it's a boat). The switch also had to be operated in sychronism with the scanners and PPI at very high speed once every second whenever the radar beam passed through dead-ahead and dead-astern. It is impossible to describe the switch design on these walls. Sufficiant to say it emitted a loud clang once every second which could be heard above the roar of four great engines. There were other modifications needed and the codename was changed from H2S to ASV Mk3 and later to Mk5. I do not recollect what happened to MK4.

The crew did not like the one-second clangs for hours on end and in the dim light were always tripping over the f*****g thing.

Towards the end of the war ASV included a valve-computer which, in day or night or in fog, when switched into operation by the captain calculated and remembered the distance and direction of a submarine conning tower or snorkel, took control of George the automatic pilot and automatically released the depth charges in the right place even if the U-boat had submerged. When a U-boat detected a 400 cycle pulse-repetion frequency instead of submerging the captain often chose to stay on the surface, uncover the cannon and fight it out forcing the skipper to release George and take evasive action. I understand in the last few months of the war very few U-boats ever returned to base. Crews knew they were on suicide missions while their families were being burned alive in fire-storms. These days we have human suicide bombs which don't need hi-tech gear to find targets.

I can offer no references for the foregoing. Just my memory banks.

You're right, Tom. Codenamed 'HS2' the earliest airbourne radar
systems were pioneered by the Royal Air Force's Pathfinder squadron.
It was a hugely significant development at a very crucial time.

>generator is working.
>

If you can smell it, then it is probably generating ozone, which is
not at all healthy. O3 is a strong oxidizing agent, which is harmful
to the lungs and potentially damaging to your equipment. The FDA has
set acceptable exposure levels for ozone, and alerts are posted
warning people to stay inside when that level is exceeded. When you
can smell it, that level has been exceeded several times over. If the
unit is adjustable, you might be able to tone it down so it doesn't
generate the ozone, only the desired ions.

A google search for "ozone generator" in the alt.support.asthma
newsgroup will provide you with many details about the dangers of
ozone and which purifiers are known to generate dangerous levels.

Ionic cleaners work by emitting free electrons, which attach
themselves to dust, pollen, bacteria and other particles floating in
the air. The negatively charged particles are then attracted to any
positive or neutral surfaces. But you need to find out where the
ionized particles are landing and clean that often. Usually it is a
grounded object, like a radiator or equipment case, but it might also
be a CRT or o-scope screen, which have a strong positive charge.

It is more likely that the needle just needs to be cleaned, but they
are gouging you the price of replacement parts.

The best headphones are made from WWII vintage sound powered
phone sets. They do require a very high quality impedance matching
transformer since the sound powered elements are very low impedance.

The trick is low loss impedance matching, and choosing the most
sensitive transducer available.

I designed and built an assortment of open frame linear power supply boards for electronic projects.

ALL are completely assembled and tested.
Jumper selectable for 120/240V input
Board dimensions 3.8" x 2.5"
Height is 1.25" or less (fits in 1U rackmount chassis)

6.3 Volt / 650 mA / $29 (tube filament supply)
12.6 Volt / 380 mA / $29 (tube filament supply)
15 Volt / 320 mA / $29 (general purpose supply)
18 Volt / 290 mA / $29 (API pre)
24 Volt / 210 mA / $29 (Neve and 990 pre)
48 Volt / 60 mA / $35 (phantom supply)
90 Volt / 36 mA / $35 (Trans-Oceanic radio, etc.)
120 Volt / 28 mA / $35 (Tube B+, great for subminiatures)

Check my website for pictures and complete specifications. Asking prices do not include CA sales tax and shipping. Credit cards OK when paying through PayPal!

I don't know about the degree of abuse in your own past postings, but as far as the Police Chief goes, he is missing in action for over one and a half years now, at least, since I first reported these kinds of incidents. You see, he happens to be British too. And no doubt, trying to be the best gentleman in appearances (would that be just like this guy in 1291 ? It is not a good idea to compare people like that.). There seems to be some kind of tracing of ancestry back to the roots of Neander Valley and camaraderie that might be going on here too in parallel with all these torture and injury and killing activities.

He goes and talks with this African American city youth leader who then talks to somebody in the fire department and then to somebody else, etc. And so it goes. Hemming and hawing and watching the fun while I am being injured and tortured and electrocuted and burnt 24 hours a day, especially finessed during the time when I am sleeping. That way there will not be even witnessed proof of the event happening ! What a brainy set of people to have thought up such a macabre ghoulish scheme and put it in operation with infinite resources of ghouls, materials, equipment and vehicles and money and everything !

It makes a lot of a difference.
Prices are higher this side of the Atlantic!!!!!! :-(:-(

There is a 10 Meter radio called the Albrecht AE485S, it is a clone of the
Radio Shack HTX-10 and can be bought from Germany for around 150 Euro used.

Is is not a VFO radio and it is not a chanelized radio.....
It has a very strange tuning. ;-) ;-) You can change each digit of
the frequency individualy down to 1 kHz without changing the other digits.
And you can jump in 10 kHz steps, not necessarily in 10 kHz boundaries
You can do 28.123 28.133 28.143 ... etc....

The latest german version has 25W in FM/SSB, and has variable power output.
And they have manuals and schematics on the Web.
No "hacking the VFO needed".

It doesnt do CW, but there is a circuit to do so on:
http://www.qrparci.org/p28.PDF

I know that you already have a RX converter, and a TX but why not a
Ten-Tec 1210 transverter kit?
Can be had for around 170 Euros from
http://www.funkamateur.de/index.htm

Greetings
Paulo Ferreira CT2ILQ

That is incorrect. The Cobra 148 is a 120 Channel AM/FM/CW/SSB box with a "slider" that can easily be modified to cover the entire gap between the channels. This box may be more familiar in other countries as the SuperStar 360.

Richard,

I see you're getting loads of replies suggesting the use of one of these Lincoln/Albrecht/Uniden/Ranger type boxes.

Given the application and intended project goals, I would suggest the following be borne in mind though when deciding

1. Cost, a Lincoln=�150, CB multi-mode �70 - second hand for good examples.
2. Modern digi readout sets are microprocessor controlled making them more difficult to modify to the degree you want in the long term.
3. Modern sets use loads of surface mount bits - hope you've got good eyesight.
4. The layout is not the modular block layout you are likely to find in the older multimodes.

In addition to the Cobra, consider any of the other readily available old multimodes. My only reason for suggesting the Cobra was it has a reputation of being more selective than many of the others.

Feel free to email me direct regarding this. I may be able to assist with information on the various multimodes that were in common usage here.

3794. Camping antenna advice

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-28 22:11:10 UTC
From: Dave <unsolicitedmale@hotmail.com>
Message-ID: <3ed53404$1_7@news.meganetnews.com>
Source record: 35195

Hello,

I'm putting ham gear in my ancient 13' camping trailer
finally, and wonder which way to go on the antenna.

Rig is an old Atlas 210X HF ('old' bands). I'm mostly
going to run 40 meter CW at night.

What I've got is an old military jeep antenna (unloaded)
It's a vertical rod essentially, with a big ball that I've
mounted on a metal tripod stand. I plan to bring a
33 foot wire (maybe 2) to lay on the ground for radials
for 40m (and 15 too I would guess). It will be fed with
coax from my Kenwood AT-180 tuner. The antenna
breaks down in small pieces, which is what I like. What
I don't like is it's so short - 12 feet I believe - not even
a quarter wave.

Would I be better off just running as long a random wire
as high as I could and just try to load into that with the
AT-180 and the Atlas?

I'm just 'armchair speculating' - I'll of course try both ways
out, but just wanted to 'yak about it' first.

Advice?

Dave WB7AWK

>AT-180 and the Atlas?

Hi Dave, You might get more advice if you posted the question on the antenna group. I have done about all the configurations that you mention, and what I would go with is a long random wire as high as possible. Try to get a good ground system, which will require radials, or use you camper or vehicle metal frame as a ground. I have used a 33' fiberglass push-up pole with a vertical wire up the pole in conjunction with a tuner on my pick-up truck with excellent results on 40M. The frame of the truck is the ground return in this instance. Of course I was not driving down the road when I did this.
Anything will work to some degree when discussing antennas. In your situation, auto tuner, best ground possible, and as long and high as possible.

One other thing. If you doubt us, perhaps you should take
a walk over to your neighbor's garage, at 1291 I believe.
Listen. Closely. Put your head against the door. You
might hear it. Perhaps this will help you understand.

You are correct - there are THOUSANDS in the US
and British governments paid to know. Paid to send
these signals.

But why do you think? Hmmm?? You've noticed the
effects haven't you? What do you suppose to be the
purpose?

Give it some thought - you may surprise even yourself.
And don't forget to check out 1291. He's one of us.

> Clive

y=ax^2 + bx + c is the general equation for a parabola.
It gives you a parabolic line.

You will rotate the line about the center for N/2 petals.
The distance you rotate will be the circumference of the
circle described by the end point of the parabola divided
by N. Put another way, when you design your parabola
for whatever wavelength and gain, you'll end up with
a design diameter. Pi times that is the circumferance.

Hope that helps.

3802. Need info on VN98AF power FETs

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-29 01:40:49 UTC

I picked up a bunch of VN98AF transistors on a broadband RF amplifier board.
They are TO-3 case style types and I'm optimisitic that they might work up
to 20 meters or so. Does anyone have any data sheets on these guys? I
believe the IRF-122 is a replacement. ?
thanks
Bob
(my return address is de-spamed)
actual is kb8tl at yahoo dot com

Funny how you can instantly find info on just about any vacuum tube ever
produced in the last 80 years but 10 year old transistors, forget it!

OK.

Depending on the design if the varactor diode is accessable on the PCB you can clip the bias wires, or cut the foil traces, going to the PLL circuit. All that is left is to install a cheap 3 terminal voltage regulator, like 10 VDC, and a ten turn pot with a dial. Wire up the pot so you have a variable DC voltage, from the regulator, connected to the varactor diode. Changing the pot setting will smoothly change the frequency, and the regulator should keep the varactor diode operating voltage constant for a stable operating frequency. He could then use either a chart of bias voltages vs frequency, or an external frequency counter to check his operating frequency.

The other option is to leave the CB rig as is and just change the crystal frequency in the transverter. The new crystal frequency would be calculated to put the transverter's IF frequency on the CB band. For weak signal work I would assume the 400 KHz of bandwidth of a 40 channel CB rig would easily cover the weak signal section of the 2m band. All he needs is to figure out the spec.'s for the new transverter crystal used to develop the mixer input frequency.

Actually the Cobra 148GTL only has AM/SSB.
The DX Models have CW/FM capability.
The 148 is a very good radio,probably the best that uniden made.
I have one with an unlocked "Voice Lock",Channel kit and Frequency Counter
that i will be putting on 10M.
I Also have a Cobra 2000 GTL which is the Base version of this radio.(it is
still stock)

It's not because he is British, or of British ancestory. It is because
he thinks you are a kook, and wishes very much he could help you out by
having you committed to a local insane asylum, but he cannot. You
cannot get someone committed these days unless he has demonstrated
beyond a reasonable doubt that he is a hazard to himself, or people
around him. Apparently you haven't gone that far...yet.

Thats for sure....

Hello Sweeden!

very informative & educative site you have Harry (have been checking
it fast but for an hour almost... & saved a shortcut for it.... can be
useful sometimes... :-)

... but for inner links directly to the some circuit page can not be
saved directly to desktop for example because of that (js_script tag?)
preventing: "Trying to copy my work? Please view & print, but do NOT
steal!" stuff (which BTW can be easily circumvented for pics &
schematics !); so shortcuts can be made only by making a New Shortcut
from Win manually copying URL.... a little bit annoying....

I see you like to use also tin cans for stuff like VHF/UHF RX/TX
MONITOR.... :-)))) for prototypes ...

Well, about that TDA7000 RX found:
(http://w1.859.telia.com/~u85920178/rx/tda7000.htm)
(similar schematics here used: http://www.qsl.net/g3pho/tda7000.gif)
I wonder why nobody tried to enhance the RX with that DiL 18pin
Phillips chip to make it much much better receiver without any outside
chip additional active RF amplifieing to make out of it a
"SuperSensitive&selective" Rx, but just almost everybody uses just
basic schematics (maybe because is easier?).

It can be done with some additional circuitry (a bit complicates
schematics & is not so simple anymore); but the caracteristics of that
Rx can be vastely improved (sensitivity better for almost 30dB; much
better selectivity & AFC Range 10x or more narrower, better audio
sound, 100kHz-150MHz Rx range...)
..... & a "toy" chip Rx with no good characteristics becomes
SERIOUS stuff.... :-)))) (no s**t!) ... very usefull for wide
range of uses...
.... I wonder how Phillips guys writing datasheets did not
think better for enhanced application! (or maybe they did but did not
want to reveal us..)

Interested (how to) ? Mail me for mine genuine innovative idea
revealing it ! :-)) he he ...
(it took a long time to mature the final schematics..)

Hello John,

Adding to your offer, if somebody can pick it up, I have an original wood (reinforced with metal) military transport box for, you guessed it, the 8551. It is a nice construction, with heavy duty handles. I got it with an HP140T mainframe but it is clearly marked in large letters as made for an 8551 system.

Only 'small' detail is that I am in Valencia, Spain ;-)

Regards,

JOSE

3810. Fluke Multimeter Help - is this an 8020A please?

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-29 09:55:49 UTC
From: Hugh Colborn <dontspamstockden@tiscali.co.uk>
Message-ID: <3ed5d906$1_2@mk-nntp-2.news.uk.tiscali.com>
Source record: 35111

Hi,

I've just bought (for next to nothing) what is probably an old Fluke 8020A. I say probably because it's actually badged "British Telecom" and seems to be given the type number "MMF 1A FIG 84/1". I assume that MMF means "Multi Meter Fluke". Anyway, externally it's identical to an 8020 type meter and the PCB is marked "Fluke 802X-A", so there's little doubt about it's origin. What I don't know though is whether it's an 8020, 8021 etc and I haven't been able to find anything useful about the 802x multimeters despite trying all the usual search sites (Google, Yahoo, Dogpile, AltaVista etc). There's plenty about the 8060 but very little about the 8020, 8021 etc. Fluke's own site seems to disclaim knowledge of it as well.

The meter is 3.5 digits and has just the basic ranges (DC volts to 1000, AC volts to 750, AC & DC mA to 2000, resistance to 20M ohms) and diode test. There's no frequency or continuity test and no sign of conductance ranges. If anybody can confirm which model it is from that I'll be very grateful. Any information on specs (particularly basic accuracy and AC capabilities) or calibration would be a great help as well.

Thanks in advance.
Hugh

Get lost creep. I usually do not need to repeat this refrain. In your case, I am not sure it works. It is called stalking. Obsessive compulsive behavior. Like someone going after another persons 'ass' for no good reason. Hyenas seem to have this problem. When too many of them gather around, it is time for people to realize that their forest is not theirs any more.

it's simple to look at, but the audio transformers makes it
complicated to build . in real life

It was great expectations for using jfets in the 70's, many
applications were silly, and I see no reason for using MPF102 when
2N2222 is many times better in the audio

My site doesn't show such circuits, but I would be pleased to show
LA6LCA high grade 2m receiver with 70MHz xtal osc, 70MHz xtal filter
for LO and doubler to 2m, with 4-5MHz variable IF

> still stock)

Understand I (and the original poster) am talking from a UK perspective, and the GTL version was almost never seen here. If you ask someone for a Cobra 148, it is the GTL-DX model that they'll give you. Our legal CB system is FM only, so such radios were mainly used by illegal "freebanders" who used them for 27MHz SSB DX working. A non SSB variant like the GTL would have been no use to them, and so there was no point in smuggling one into this country.

As for the 2000, that was also a great rarity here and used to command quite a high price. Now that 10m monobanders are legal to import into the UK though, its much easier to get the Lincoln, 2830 and such sets, and the old channelised multimodes are much more realistically priced.

Unbelievably, I got 150GBP (over $200US) for my expanded 148 when I sold it only three years ago! Wouldn't get 70 for it now....

Lots of tranceiver boards about, but what I may want is to be able to buy a good SSB/CW/ poss AM IF amplifier. Then it would be nice if you could choose a particular RF front end for your desired band. I just don't seem to have come across something like this. Can always easily make the AF and PSU.

Know of any particular manifacturers?

Hi Richard,
I've got a couple of designs on my website:
http://home.att.net/~n.gianakopoulos/wsb/html/view.cgi-home.html-.html
You will find both AM and AM/SSB designs up there. There are ZIP files
which contain all of the design information, in PDF form, including
schematics, board layouts, and parts placement. If you choose, you can just
populate the portion of the board that you need. Since I have released this
information to the public domain, feel free to use the design information,
and tailor it to your own needs.
I have developed an I.F. amplifier board for my own
experimentation.....I still have yet to post it up the the
website.
I hope this helps.

Pete

3828. So few hits. Why is this?

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-29 22:39:24 UTC
From: Richard <nearlynews_email@ntlworld.com>
Message-ID: <bb622h$652nk$1@ID-150848.news.dfncis.de>
Source record: 35129

I put into Google "455 Khz IF amplifier". I get 19 hits.

I put into Google "9 mhz IF amplifier" and I get 3 hits.

"10.7 Mhz If amplifier" and I get 26 hits.

Does no-one design these amplifiers any more?

Why so few hits? I though designers would be designing IF amplifiers
for their RX projects, and that the above searches would have produced
lots of hits.

The version I knew would be am but that could be wrong. Not much of a
Cobra fan then.

Actually an easy one to mod is the older RS TRC57 (not the later 457).
I did one for a friend as a really nice am/ssb/cw 10m rig. That would
be maybe a tough find but, a easy mod candidate and like cheap due to
age.

Of course, there are lots of IF amplifier circuits and front end
circuits. Esp. in books.

Just wish I could put in ("455 Khz IF amplifer module" SSB/CW) and
see dozens of 455 Khz SSB/CW IF modules. :c) Similar for front ends.

That's funny.. when I put in 455 Khz IF amplifier, I get over 4,000 hits.
Are you enclosing the entire string in quotes? Try the search without them
and see the results. Remember, when people author web pages, sites, and
newsgroup posts, they may not phrase everything exactly as you do. Loosen
up a bit on the search terms and you'll get lots more hits. Try different
words in your search that mean the same thing. For instance, some people
may call it an "IF strip" instead of an "IF amplifier".
Go Googling again and be more flexible.

My recommendation: don't limit your search quite so much. Drop the
"IF" part, or put in the search string without quotes. Try putting
the units next to the digits of the frequency: 455kHz, 9MHz and
10.7MHz for example. Try it without the frequency specified; it's
often easy to adapt ideas from one design to other frequencies anyway.
I got LOTS of hits with just 455kHz IF amplifier as the search
string.

Cheers,
Tom

You did pretty well to get that many hits, and there should be enough
in them to answer any sane design questions - how many do you want,
how many ways are there to design an IF amp on ANY frequency? If you
want more detail, you will need to go to a decent (probably
university) library. What precisely do you want that hasnt been
covered in what you have found?

If you actually used the quotation marks, Google will only find sites that contain that complete phrase, exactly as written. If you didn't, it will ignore the bare numbers "9" and "455", and also common English linking words like "the", "and" and... "if".

www.google.com/advanced_search.htm is actually easier to use than the plain one-line version, because it lets you fill in a more detailed form.

Try Hands Electronics at www.rf-kits.demon.co.uk As the name implies, those are kits.

Also there's a superb SSB/CW IF strip at the Warrington ARC site (maybe www.warc.org.uk?) in the "CDG2000 transceiver" section.

Both of these references also have modules for other parts of a transceiver: synthesizers, mixers and band filtering, and transmit exciters.

Still little luck finding say a 455 Khz IF amplifier circuit on the web.

Not that easy.

Hi.

Incase anyones interested, I've almost finished a little program to help in making a dish.

<http://www.nospagetti.co.uk/dish_design.zip>

I'm not sure how far to expand the petals out from the real circular dish curve, but it looks sort of correct to me. The petals are cut from flat sheet. ALSO, the, I've yet to finish the 'Print Petal' routine, it only prints out on one sheet atm.

Feel free to let me know if I have it completely wrong, but be gentle :)

Heres a piccy of a wooden former I've made with the help of this program ...

<http://www.nospagetti.co.uk/dish.jpg>

It's for building a couple of grid dishes btw, the wire on their atm is just a test to see how easy it is to wire up.

Regards

Clive

Check out:

www.mods.dk

Select Kenwood. In the lefthand side of your screen there is a item called manuals (they are actually on an other site). Go there and you will find manuals for your TS-450 as well as schematics.

Good luck!

I have an 8020 B here that I just opened and the board is labeled
802X-B, with some other numbers below it, including a revision letter.
This one also has a smaller daughter board on top of the main board.

>The meter is 3.5 digits and has just the basic ranges (DC volts to 1000, AC
>volts to 750, AC & DC mA to 2000, resistance to 20M ohms) and diode test.
>There's no frequency or continuity test and no sign of conductance ranges.

This one has conductance (milli and nano Siemens.) I thought the diode
test also tested continuity.

>If anybody can confirm which model it is from that I'll be very grateful.
>Any information on specs (particularly basic accuracy and AC capabilities)
>or calibration would be a great help as well.

I have a manual for this somewhere, but it doesn't sound quite the
same. I'll look for it.

As important as designing a surface is, it is equally important to select an F/D that can be illuminated by a real world feed.

Thanks Jim,

Based on information kindly sent to me by Fred McKenzie it looks as though what I have is an 8021A. It doesn't have the daughterboard but that may be one of the differences between the A and B models.

> This one has conductance (milli and nano Siemens.) I thought the diode
> test also tested continuity.

Interestingly, although it's not marked anywhere on the meter, I've now discovered (again with Fred's help) that my meter does have a working 2mS conductance range but not the Nano Siemens one. The diode test function certinaly works (produces enough voltage to turn on a diode junction) but I'd assumed that any continuity function would produce an audible beep or buzz. My meter certainly doesn't do that.

Anyway, thanks very much for replying to my query. Your information is much appreciated.

Regards,
Hugh

3849. Call to RX designers (ie somone)

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-05-31 08:55:22 UTC
From: Richard <nearlynews_email@ntlworld.com>
Message-ID: <bb9qik$79i2g$1@ID-150848.news.dfncis.de>
Source record: 35051

If you have not already done it, could somone please take the module approach to designing.

I'm after flexibility, and to builld up a collection of RX Front End modules , IF modules, VFO modules , PSU modules, RF amp modules etc.

And if anyone takes that approach could you please identify in your web pages the modules, I mean if you design a 455 Khz IF module, then somewhere in the page or page title write "455 Khz IF module". :c)

Also, if anyone has a web page where the RX (or even TX I suppose) is broken down into modules as part of it's construction then please post the URL and I'll take a look.

I think there should be a "modular design" movement in amateur radio. :c)

Of course there are probably lots on RX modules around, Particularly in textbooks. Anyone care to create webpages based on a "modular design" basis. Each page is dedicated to the fundamental RX modules for instance) or even TX modules.

If not, I'll try to do it myself, but I cannot design. So circuits will have to be others with permission.

Rich.

P.S. Offbeat post I know, but I think there is some merit in the idea of modularisation, in particular the presentation of designed units as modules on a web page or pages.

I'm saying that the design of module has it's own PCB, so you can make just an IF amplifier, or just a RF front-end.

But, I think the designer will say there are particular difficulties with modules. It's okay if you design one module in relation to another, but hard to ensure one module fits in with a "foreign" module. Okay you can try to standardise the supply voltages. Or you could even have seperate supplies for each module. But what do you do with AGC, if you ever wanted to try another IF module with the RX front-end? Probably the person tring to connect the modules would have to design an interface to make the AGC compatible.

Anyway, I still prefer my RX's to be modularised.

Of course, all RX's are essentially modular, because you can break it down as such in circuit terms. Nice though if things were broken down in PCB terms.

In any event, if your design is broken down in PCB modules, then perhaps you could indicate this by writing, for example, "455 Khz IF module" or "RF front-end" somewhere in your webpages.

Rich.

Eratta: "RF front-end module". I think "module" included is much better
for searching. "Module" should always be the end word in the string.
Ie, "PSU module" etc etc. Not essential, but particularly if you
created PCB for the module.

Actually maybe that should be the criteria, you write "RF front-end module" if indeed you have a PCB designed that goes with the module. But, that could be too restrictive, not though if one is only interested in modules with PCB designed already.

One wonders whether there should be some kind of nomenclature (it that is the right word) for webpages, something that can make finding circuits easier. The way to do that would be to settle on complete word strings. Most of the time with searches I get pages that are not what I want. I tried searching for pages that showed 455 Khz IF amplifier designs. Very slim pickings. But, maybe there are non, or very few.

Probly unworkable, but with my web pages, if the content showed a 455 Khz IF amplifiier circuit or was a complete construction module I would ensure that I wrote in the pages "455 IF amplifier circuit" or "455 Khz IF amplifier module". But, that's just me.

Whoever started this thread is having a search engine problem. If you'll correct that, you will have no problem finding yourself saturated with designs. Google turns up 15,000 hits for 455 KHz IF in 0.78 seconds.

What you initially asked for, is readily available in a half dozen books and any collection of old magazines. (Even in some new ones) Try solid state design by Hayward and DeMaw, Introduction to RF design by Hayward, and Experimental methods in RF design by Hayward, Campbell and Larkin. Any or all of these ought to be in your personal library if you have any serious intentions other than trying to standardize other folks web designs.

My meter certainly doesn't do that. >>

Hugh-

Back home, I took a look at my 8020A meter. It has different markings than the 8020B in the catalog.

There are only three columns: current, voltage and resistance. The 20 Megohm button is only used for resistance and conductance. It is used in conjunction with the 2000 KOhm button for nS and the 2 KOhm button for mS. Although the manual tells how to access the 2 mS conduction scale, it is not shown on the meter itself. Perhaps yours is documented in the 8021A manual? (The 200 nS buttons are indicated by a "grayed" area between the scales beside the two buttons.)

According to the manual, DC voltage is 0.25% of reading plus or minus one digit on all ranges.

AC voltage accuracy is more complicated, depending on range and frequency. Basically it is 0.75% +/- 2 digits from 45 to 1000 Hz, except 1% on the highest (750 volt) scale. From 1 kHz to 2 kHz it is 1.5% +/- 3 digits up to the 200 volt scale. It isn't rated at the highest scale. From 2 kHz to 5 kHz, it is 5% +/- 5 digits up to the 20 volt scale, and not rated above that.

Resistance is 0.2% of reading +/- one digit except 0.3% +/- 3 digits on the 200 Ohm scale and 2.0% +/- 1 digit on the 20 Megohm scale.

Conductance is 0.3% +/- 1 digit on the 2 mS scale and 2.0% +/- 10 digits on the 200 nS scale.

DC Current is 0.75% +/- 1 digit on all ranges.

AC Current is 2% +/- 2 digits on the 2 mA scale from 45 to 450 Hz, 1.5% +/- 2 digits on the 20, 200 and 2000 mA scales from 45 Hz to 1 kHz.

You asked about calibration procedures, which you can get from an 8021A manual. Actually, I suggest you not touch it unless you have access to laboratory standards. Recently I purchased a couple of old Fluke bench meters. Comparing them both with the old 8020A on various voltages and resistances, they were all exactly the same except for one measurement: a 13.80 volt power supply measurement differed by one digit (.01 volts). Unless someone has messed up your calibration, it is most likely still better than anything else you have!

73, Fred, K4DII

I think every designer takes a modular approach to designing.

> I'm after flexibility, and to builld up a collection of RX Front End
> modules , IF modules, VFO modules , PSU modules, RF amp modules etc.

If you look at the various designs on the web, you will find that most designers steal liberally from other designers. Each radio may have one unique circuit, or perhaps assemble circuits in a novel way, but most of the circuits will be tried and true designs pioneered by someone else.

> And if anyone takes that approach could you please identify in your web
> pages the modules, I mean if you design a 455 Khz IF module, then
> somewhere in the page or page title write "455 Khz IF module". :c)

People don't do this, because it isn't really useful. While the idea itself may be somewhat portable, the design has to fit into a particular radio, and there are so many variables that the chances of picking up a circuit that can be dropped right in are slim.

Consider a simple mixer. You might have an active mixer, a passive mixer or a Tayloe mixer. You can't drop a Tayloe mixer in where an active mixer used to be, because the Tayloe mixer needs a quadrature LO. And the passive mixer won't drop in because it needs higher levels of input and LO. Of course, there are also an unlimited number of IF and input frequency possibilities, all of which affect the design. One of the main differences between various receiver designs is the distribution of gain throughout the receiver. Guess what, that affects every stage. Were you to come up with a generic mixer module, it might work in one in a million designs. You might get a little better hit rate with front ends, and there are lots of VFOs out there because the VFO has no inputs and only one output, so the hit rate tends to be a little better. Same with audio stages which have only one or two inputs (audio and mute). But for the rest of the stages, trying to make something generic is somewhat of a loosing proposition.

Hands, Kanga and others sell various modules. The result tends to be a little unsatisfying. The radios tend to be somewhat lower performance and higher price, as well as a lot larger, than radios designed to fit together.

> Also, if anyone has a web page where the RX (or even TX I suppose) is
> broken down into modules as part of it's construction then please post
> the URL and I'll take a look.

Generally, the construction isn't broken apart. Not only is there little advantage, but users of the modules aren't likely to be able to manage the layout that well. Remember, lots of the parts are at RF, and RF doesn't like to stay in the wires as well as you would wish.

One recent example, tho, is the Multi-Pig+. A half-dozen or so examples were shown at FDIM this year, and it does appear that builders can put together a handful of modules and come up with working radios that look quite different. However, the modules work together, they really aren't as generic as you would like. And the resulting radios are pretty large compared to the capability.

> If not, I'll try to do it myself, but I cannot design. So circuits will
> have to be others with permission.

No reason you can't design. There are plenty of examples of how to get from A to B, and you can model the circuits with Spice pretty easily, so you can get an idea of the performance before committing them to copper. And take a look at the Manhattan construction technique popularized by K8IQY as a way to avoid having to etch boards. It can certainly ease experimentation.

> P.S. Offbeat post I know, but I think there is some merit in the idea of
> modularisation, in particular the presentation of designed units as
> modules on a web page or pages.

There is merit, of course. But the price is very high - too high for most hams who are typically looking to get good performance at a low price. Homebrewers in particular tend to build a radio, use it for a short while, then build another. They aren't going to spend $400 for the same sort of performance they could get for 100. But that's the sort of price differential I observe for the modular approach.

..

>I have a manual for this somewhere, but it doesn't sound quite the
>same. I'll look for it.

I should have added that Fluke, at least at one time, took pride in
making manuals available for any device they had ever made. They
weren't free, but they were reasonable. I had to buy the manual for my
8020B because it needed repairs and the manual included a schematic
and parts list.

You might tty contacting them and seeing if they can sell you a manual
for your 8021A. The manuals folks might be able to remember that such
a DVM actually existed. ;-)

Those books do make great webpages. And they have wonderful built in
search engines at the back, so you can usually find what you want very
rapidly.

There's also the equivalent of the Web for books, which some like
to call a library. Full of those old style webpages, and easily accessible
without a computer. Those library places have search engines too, though
some may still have them in the form of a paper card catalog. And
the information is nicely clustered, so if you find one book of use
to a topic, the other books with the same topic are right next to
it. Some Dewey guy set that up at least a few decades ago.

Look at how many hits show 455 Khz IF circuits or construction articles.
Very few. You have to really search. This may be because there are not
that many 455 Khz IF circuits on the web. If so a pity, I'd like to
build one around good quality filters, like Collins filters, or
whatever.

Getting those books I agree would be a good thing to do. Although I was
hoping to just copy someone else's designs. :c) Why not, why re-invent
the wheel if there is something out there that is okay for ones needs..

Understood.

I guess it's more realistic just to expect a modular approach to a
particular overall RX or TX design. In the sense of the modular parts
build on seperate PCB's.

For the RX I was thinking of "typical" modules for a superhet. That
would mean active mixer, but the gain distribution issue is important.

Hi Richard,
This website might prove helpful:
http://home.att.net/~n.gianakopoulos/wsb/html/view.cgi-home.html-.html
I went through the same thing that you are going through, many years ago, so I had to design my own I.F. strip. The AGC portion was another nightmare; I tried the ARRL AGC circuits, but they weren't satisfactory for my purposes, so I needed to design my own. My early I.F. systems used a pair of MC1350 chips; along with an op-amp in the AGC loop. They worked very well, but when I discovered the TDA1072/TDA1572 chips, I decided to go with that route in my newer designs. These Phillips chips have the detector and AGC amplifier on board, and the 1572 has an I.F. output, suitable for feeding SSB and FM detectors. This is exactly how the designer of the AOR7030 implemented this device. The Linn Kudos FM/AM/LW tuner also uses a TDA1572 in its final I.F. strip. Yes, that Linn tuner is dual conversion on the AM/LW band.
Eventually, I decided to include the 1st and 2nd mixers, the I.F. strip, the SSB detector, and the audio amp on the same PCB.
I got my PC layout experience as a PCB designer for my first couple of years at Rockwell-Collins; henceforth, I learned what it takes to produce a good board design.
Anyway, take a look at that website; I have uploaded PDFs of the schematics, board layouts, specifications, and parts placements. On a final note.....the MDS of the receiver is between 35 and 45nV across the tuning range, depending on the band, and that is with no RF amplification ahead of the 1st mixer. The IP3 is +14dBm, which isn't too bad.
You can break down this circuit into different modules, and it will work fine. I already have it broken down into these modules as it stands: Power Supply, DDS, Preselector, and Main Board.

Is Mike Byrd still in the surplus business over Byrd's Coin Shop in
Dayton? I think it was called A1 Surplus. It was between an adult
bookstore, and a Christian Science Reading room, and every time I went
to see Mike, the cops were around the corner taking down license plate
numbers. they were rather upset when you parked, walked right past the
adult bookstore, and went into the coin shop or up the stairs to the
second floor.

Hi gang,
In one of the RSGB's Technical Notes compendiums, there is a simplified version of PA0KSB's Huff & Puff oscillator stabilizer. The schematic shows a HC4060 counter chip with 2 outputs feeding an integrator. One of them is labeled pin 3 the other is blank. Also, the text below the schematic states Q11 and 13 are the outputs used from the 4060, but pin 3 is not one is these......so I have nothing but questions... ;) Does anyone have a complete and accurate schematic for this circuit?

Thanks
Bob L. WB0POQ

I'll be designing an IF amplifier module to go with it, which could be
followed by
my direct conversion Rx module as a high-performance product detector.

All modules are 2" square.

They probably had a correction in the magazine issue after the original
schematic was published. Perhaps you can get hold of the issue.

Ahhh - the advantages of having the entire series on CD-ROM. The article on how to make such paraboloids in in the December 1973 issue with a correction in the February 1974 issue. The formula isn't given as far as I see per se, but a spreadsheet approach is.

If you can't find it, let me know and I'll figure out what the formula is that he used.

Excellent.

I am a "module person".

Seems to make building simpler, because each board is relatively simpler
than a board with everything on it. And you can experiment easier.

Will watch developments with interest.

I'm particularly interested in a high quality IF amp using xtal filters.
I don't even mind bulding three IF's one for AM, one for SSB, the other
for CW. Although not strictly necessary to go that way. :c)

I'm trying to fix a Kenwood TR-7800 2 meter rig, and suspect that the CPU is the problem. Does anyone have a datasheet for a UPD650C-037 ?

Someone sugested that the CPU supply voltage might be the problem, I measured it at 5.17 V DC. This seems odd, I've seen chips that run at 5V or 6V but not between. I need to know what the needed VCC for the chip is so I know if I have to replace a regulator somewhere or add a zener or if I'm on the wrong track.

Regulators typically have a 5% or so tolerance on the output voltage, so it
might be OK for a nominal 5V supply.

Out of curiosity I went alooking.

The SCR-274N manual wasn't too helpful, saying only that the voice response of the BC-453 is well down at 1,500 hertz. However, Byron Goodman's (W1DX) one-page article in QST for January 1948, "The Lazy Man's Q5-er", shows a graph of the receiver's overall response with the variable I.F. coupling set to minimum. Surprisingly it is not as good as I would have thought with a 6dB bandwidth of 2kHz and shape factor of 3.25 (6/60dB).

Cheers - Joe, G3LLV

Nearly all 5 volt ICs also have a 5% tolerance on the DC supply voltage. So 5.17 volts is normal and almost certainly well within specifications for the IC. I think it's very unlikely that the 5 volt supply is the problem -- you're on the wrong track.

That does seem less than was implied all these years.

But, of course we are talking about 55 years ago. The whole point was to get better selectivity, but connecting the receiver to the 455KHz IF of your regular receiver. Likely the average receiver at the time did not have such great selectivity, so by adding the Q5-er one ended up with better results. It's all relative. Nowadays, people wouldn't bother because there are better ways of getting selectivity, so how many have gone back and looked at the actual specs? It worked then, and that was all that matters.

Put a surplus 455 kHz Collins filter in. But, I guess if you had one, you wouldn't need the BC-453...

Hi,

IMHO, the simplest (and one of the best) CW filters is still the single crystal one by Lamb dating from the 30's, that was almost a standard fit to boat-anchor receivers up to the 60's. And, with the very low cost of computer clock-rocks today, it shouldn't be too difficult to implement; complete with its distinctive ringing sound (with a high-enough Q crystal) and the free notch thrown in.

I am currently using a series 198kHz crystal filter in a frequency standard receiver but, as I have no need to neutralise the parallel resonant notch, I didn't have to modify any I.F. transformers to feed it. On page 16.18 of the 2000 Handbook, they show a bifilar wound feed instead that should be easy to make up.

OK, let's see if someone can suggest a right track.

The radio turns on, the squelch works, the speaker outputs static. That much works.

The LED display only turns on approx 30% of the time. When it does I can change frequency with the up/down ocntrol on the mic. When I try to key in a new frequency on the front panel about half the time the radio just dies, the other half it changes freq. Problem is the 2,5,8,+,- keys don't work either. When the radio turns on properly and the frequency changes without the radio dying I can hear the outside world. I haven't dared to try and transmit on it, who knows what might happen.

If any of these symptoms sound familiar to anyone who has a Kenwood TR-7800, please let me know.

Steel core? Seems like a very low inductance for a steel-core
(iron-core) part. What freq range? Uncommon for steel to be used
much above audio freqs. Shouldn't be too much trouble to wind one on
a ferrite or powdered iron core. And I would guess DigiKey and Mouser
would both have things in that range (270uH). Both have on-line
ordering. To find one to buy, you'd usually specify the max current
rather than the wire gauge. Max current can depend on the wire or on
core saturation.

Cheers,
Tom

OK, its time for some systematic fault finding. Do you have a service manual for the thing - if not, get one, or at least a schematic. As mentioned before, the Vcc for the micro is probably OK - if you want to be fussy, stick your CRO on the line and see what the ripple/noise is (proably not much).

The led turns on for 30% of the time and the radio works - when it doesnt turn on, try poking/tapping/stressing the baords to check for a loose connecton. Try heating and cooling - a domestic hairdryer for both functions works well.

If this doesnt localise the fault, check the cpu xtal is oscillating. Check all pin voltages, you should be able to work out approx. from the schematic - in particualr, check data in/out lines ie as you toggle the up/down buttons.

At the moment, this is all I can suggest - if you can hold it up in front of your monitor so I can see it I will try a bit harder hi hi...

Good luck, its a great feeling when you crack a hard one - and BTW, micros very seldom fail....

Regards,
Andrew VK3BFA

It sounds like the keypad is faulty as well - take it out of circuit
to avoid compunding your problems, if the up/down buttons work then
you dont need it at this stage and you can treat it as a separate
fault later.

A much more effective way of cooling is a can of spray cooler, available from just about any electronics store. If you can't find any, get a product in a pressurized can sold as a compressed "air" duster. It's essentially the same stuff (similar to Freon, but now allegedly without the ozone-depleting properties), but without a siphon tube -- spray with it upside down to make the liquid come out. You can get this at computer and office supply stores.

The shock of the sudden cooling reveals a variety of problems, so spray cooler is very often the first thing a technician reaches for in order to track down an intermittent problem.

I'll bet your problem is not with the micro or the 5v that feeds it.

90% of problems in older radios of that vintage are with sockets/connectors/wiring. As it was stated, poke around... gently the boards. If the micro is in a socket, carefully let me repeat... CAREFULLY remove it and clean the pins with a pencil eraser. They will be very brittle, so you need to go slow. Same proceedure for connector pins. As someone else could also be the keyboard, especially tricky if the problem is a key or two that gets stuck and cause the code in the micro to do funny things on start-up.

Go slow, it's not rocket-science. I know very often we tend to jump into the worst possible scenario but the problem is usually something very, very simple. Let us know what you find.

Hey folks!

I have come accross a stash of Trio (Kenwood) TA-100WA, TA-200WA, and TA-80WA. They are marked "Pure Complementary Power Amplifier".

They were given to a friend, and he was under the impression they were audio amplifiers...?

Does anyone know a source of information and/or datasheets for these parts? I have quite a few of them, and would like to put them to use!

Thanks for your help!

I didn't have the '48 QST, and I've been curious, it got
a lot of recommentations in the 50's and 60's QSTs.

I'm embarrased to admit that I was thinking of using a BC453 as a way to
get RIT and cw filtering on my KWM-2...

There are lots of circuits on the Web using the Analog Devices 9850 DDS chip, for example

http://www.geocities.com/SiliconValley/Code/1835/dds.html

The Analog Devices data sheet gives a very minimal circuit. Layout is surely critical to getting a clean output.

Cooling spray is also one of the most misused aids in the hands of an
untrained or inexperienced technician. I've seen techs waste half a can of
the spray on a circuit trying to make something fail, because they didn't
have the knowledge or training necessary to do proper troubleshooting.
The proper way to use it is to spray a quick burst of the coolant onto
specific components that are under suspicion. You don't normally flood an
entire circuit with the stuff, to the point of having the whole assembly
encased in a block of ice. Use it sparingly, along with a good measure of
intelligent troubleshooting. A can will last a lot longer that way, and it
will have served you better.

It was really great, in the 50's and 60's when most receivers
that didn't cost a fortune had bandwidths ranging from 4 to 10
kHz.

But for a number of reasons it isn't something you'd want to do
today other than as a demonstration of what was useful back
then.

Seems to me that it was possible to get it down to something
close to 1kHz, but I don't remember now how, or if positively
if. I may have added a little feedback to get a Q multiplier
effect to achieve that.

>> > That does seem less than was implied all these years.

And additionally many (most?) receivers and vfo's weren't stable
enough to make a 250Hz filter useful! At 1-2kHz it was unlikely
the signal would drift off too far to hear them at all.

>> Put a surplus 455 kHz Collins filter in. But, I guess if you had one, you

I set up several BC453 Q5'ers in the early 60's. The first
receiver that I used was a pair of ARC-5 receivers, the 7-9mHz
one followed by a the BC453. I don't remember what they cost,
but it was all a 14 year old could afford.

But besides not being really all that selective by todays
standards, the problem with putting all of the selectivity at
the end of the IF chain and all of the AGC action before that
selectivity, leads to a less than pleasant experience if you are
likely to have adjacent signals that are relatively strong.

Dont forget that little piece a paper that says that if you want to do
it that way....do it!! Its your right as an individual! If you cant
find a original Q-5er there was a grey version made later with no
calibrated dial that is otherwise a carbon copy and so far has been a
lil cheaper

The WB2V circuit is pretty minimal, fairly popular, and Far Circuits sells the board. I think they also sell the QST article, although most of what you need was on the NJQRP site a few months back. They have since rearranged their site, tho, and I haven't been in search of that particular circuit since.

Although the original article used a 66 MHz oscillator, the part will work at least up to a 120 MHz oscillator on that board. The higher the oscillator frequency the easier the filtering and the less the phase noise, as well. The 120 MHz oscillators do draw a tad more current, but they are just as available as the lower frequencies.

Note, however, that "clean" is a relative term. Any PLL or DDS circuit is going to have a certain amount of close in noise that is virtually impossible to filter. The 9850 with a 100 or 120 MHz clock is pretty good, but it's not going to be as clean as a well designed analog oscillator.

..

Hello Roy,
the problem with freezer is that it has become so damm expensive
especially since we now have to be "environmentaly responsible". I
find the hairdryer hot finds a lot of faults, and on the cold setting
it will cool the lot down quickly. So saying this, I do use freezer
(must order another can this morning) but only to confirm a diagnosis
- its too expensive to shotgun a board with..

I guess I have to put my 2 cents in here. One of my favorite toys is a
BC453 with an all band dual conversion converter ahead of it. I drag
it out every couple of years and make a few modifications on it.

I built it back in the 60s and keep improving it. It has amplified
AGC, a product detector, side band selection and an S meter. Covers 5
bands triple conversion, all with one 3.5 mhz crystal. Phone bands
only.

The selectivity is not bad. With the IFs set in the sharp mode I think
the nose is around 2 kc. The skirts are ok, not real steep like a
collins filter but adequate. It is more like a Drake 1A or 2A as far
as selectivity goes. Stability is excellent. I do get some images
pretty bad on some bands though. My first IF does not have enough
selectivity. Some day I am going to add another IF transformer there.

The audio quality is excellent on it. Of course I am using all new
audio stages in it. 6V6 in the output.

It will work pretty well as a CW filter behind the KWM2. Tuning it to
455 kc you will have a variable bandwidth filter! You can make the
bandwidth as sharp as you want it by just tuning the main dial across
the 455 kc IF in the KWM2. One side of the skirt will be the
mechanical filter and the other side will be the 85 kc IF. Of course
that side of the curve will not be quite as sharp as the mechanical
filter side but it won't be bad.

If you get creative and add a product detector and an agc circuit, you
can feed the agc back to the KWM2.

Be careful not to overdrive the product detector with too much 85 kc
IF. I had that problem with my little receiver for a number of years
until I figured out what was going on. With all the added gain from
the converter and the already hot BC453 I had lots of IF gain. I
copied the product detector from I think Stoners handbook. It turned
out that the coupling capacitor he used was way too big and over drove
the product detector. Works nice now.

It is also easy to overdrive the IFs if the BC453 is fed from an amplified stage as it is pretty hot. That contributes to product detector overdrive.

Have fun.

I have the schematic and plans for something they called "the universal Q5'er" in the 1956 Radio Handbook. Looks a bit more flexable than the original. If I can get it scanned, I will post it.

A PLL would be rough to directly tune in that range, because of the
difficulty of designing a VCO with a flat KV characteristic over that kind
of tuning range. You could have the oscillator running from 45 to 75MHz,
though, and translate it down with a mixer, but that complicates things a
bit. A DDS is an ok way to go, if you don't mind those artifacts in the
output. I've got a DDS design up on my website that tunes from 10.7 to
40.7MHz, and by changing the assembly code and recompiling, the unit will
operate with no offset, meaning what you see on the digital display is what
you get at the output. I do have new code, that lets you program the offset
on the fly, and it is designed to work with the 2-line Optrex type of
displays that you see on the surplus market. This is for an Analog Devices
AD9851.
I hope this helps.

Back in '62 I was a tech at the Army TV station at the Signal School at Fort Monmouth, NJ.. For a time I was assigned on a pair of very early videotape recorders. That was long before cassettes of any sort, these things used 10 inch open reels of 2- inch wide tape rolling across an open headwheel assembly
spinning at 16,750 rpm, and the machine consisted of three 6 foot equipment racks full of chassis which were mounted on slides so that each could be extended outside the rack for service. Compact it was not.

One day the thing developed a problem which placed a horizontal black line across the screen. I soon traced the difficulty to one of the slide-out chassis, and extended it, preparing to test further when the trouble disappeared.
The drop in temperature, not that many degrees from the forced air environment inside the cabinet rack, was enough to make the problem disappear. When I slid the rack back inside the cabinet, the fault would come back.
So I had to take the opposite tack in isolating the faulty component. I used a desk lamp held close to the circuit board to heat the board and induce the fault, then used a file card to cover each component on the board until I shielded the one which, with the heat source removed, caused the trouble to disappear. The problem part was a diode which had changed characteristics just enough. Replacing the diode cleared the fault.

I had a can of spray coolant, but not one with heat. : -)

Low tech indeed, but quick, and equally effective.

Junkbox Surplus Parts for Sale as of 05/31/03
==========

NEW ITEMS

I have 200 excess pcs of 5.000 Mhz crystals. These are the miniture crystals like you see in the latest QRP Quarterly. Tiny round crystals with two wire leads, I think I've seen these in watches. If we ever get 60m these could be a lot of fun.
50 for $4.00 shipped to the USA.

I have 400 pcs of 102J (1000pf) Shinyei ceramic caps rated at 630 VDC. These are in bags of 200.
$5.50 for 200 including USA shipping.

I have surplus 50K 1 Turn linear taper pots, about 25 each. These are chassis mount pots with the nut. About the size of a nickle, and about 1/2 inch deep with a 1/4 inch shaft about 1/2 inch long.
5 for $5.00 including USA shipping.

2.5/5.5mm Coaxial Power Jacks for PCB insertion or Manhattan install
10 for $2.50

285pf Green Square Plastic Cap, PC Board Insertion 10%
100 for $4.00

220pf 5% 63V SMD Caps - Surface Mount size is 0806
50 for $1.00 PLUS you must send a SASE for return.

Odd Items
==========
9.8304 Mhz Crystals, 1/4 in tall - 20 for $5.00
27mH inductors with radial leads - 25 for $3.50

Caps - All new, old stock. No pulls.
==========
All caps now 50/$3 or 100/$5
==========
8pf NPO Ceramic - Loose
11pf NPO Ceramic - Loose
12pf NPO ceramics on tape
22pf Kemet Ceramic Caps, 200v, 10%
150pf ceramics, 100v, 10%
470pf Ceramics on paper tape, rated 5% (NPO)
560pf Kemet Ceramic Caps, 200v, 10%
1000pf blue mono caps, 10% 100v
3300pf Kemet Ceramic Caps, 100v, 10%

.01 uF ceramic caps, 10% 100v brand new by Kyocera
and
.01 uF ceramic caps, 20% 50v, new old stock, not used
50/2.50 100/$4

Voltage Regulators
==========
L7805ACV voltage regulators TO220 case. 10/$5 or 15/$7 100/$30
LM7812 voltage regulators. TO220 case. 5/$4
LM317T Adjust. Positive Voltage Regulator TO220. 10/$5.00 or 15/$8.00
LM78L62ACZ Volt(6.2)regulators, TO92 format 5/$3.00

Transistors - New Parts - No Pulls
==========
TP2222 plastic TO92 NPN (House brand 2N2222)50/$4 100/$7
2N3904's plastic TO92. NPN - 50/$4 100/$7
2N3704's plastic TO92, NPN - 50/$4

Op AMPS
==========
LM386N-1 - Audio Amps 5 for $3.00

LM741CN - Single Op Amp, 8 Pin Dip, 6 for $3.00
http://www.hep.ph.ic.ac.uk/~hallg/Instrumentation/Data/LM741.pdf

Diodes
======
1N4148 - You always need these. 100 for $2.50

Let me know if you're interested. All prices are post paid to the
USA, unless otherwise noted. I will ship to non USA addresses but we
need to discuss the shipping charges first.

I would like to build a morse code oscillator circuit that utilizes an MJ2955 (PNP) power transisitor. However, I don't have access to this transistor, but do have access to its complimentary transistor, 2N3055 (NPN). Can I just reverse the polarity of the battery that powers the circuit so that I can utilize the 2N3055 instead?

That must be some morse code oscillator !

Does it just not bother with RF and generated a loud enough tone that RF is not required or something ?

Those transistors are somewhat beefy for a ickle audio oscillator :)

Hi,

The Oki MSM5524 is both a Display and Frequency Counter widely used in FRG7700 and R1000.

I managed to save a couple of them during the early 90's and they are still in good condition. Each IC will cost US60. They were bought as spares when I previously repaired my R1000. Hopefully, it may help to solve your malfunction display.

I can email you a softcopy of the R1000 schematic as well.
Let me know if you like to have the chip for repair or spares.

Thanks and Regards
wor

About 30 years ago for a dollar or two there were some circuit board CPOs
that used a to-3 power transistor with no heatsink and another small one.
Think they ran off either one or two batteries. You hooked the batteries ,
key, and speaker to it. Don't remember a volume control. They were not all
that loud.

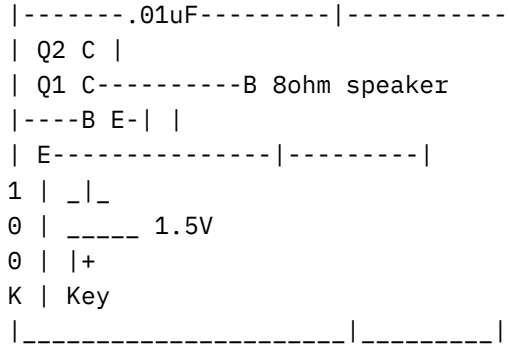
For that matter, the first ARRL Handbook I ever got, the 1971 edition,
has a similar circuit.



I hope that's clear.

Q1 is a small signal NPN, and Q2 is a TO-3 PNP. I'm too lazy to
look up whether they were germanium or silicon, but a possible transistor
for Q1 is a 2N2102 and Q2 is a 2N2869

The emitter of Q2 does not connect to the emitter of Q1, in case my drawing is not clear.

This sort of circuit showed up in quite a few places.

Looking for suggestions for conformal coatings for PCBs.

I am looking for an opaque coating but have had no success in finding a coating that is not transparent.

Any leads would be appreciated.

Out of curiosity, WHY opaque? :-)

Conformal coatings have been used to protect circuit board
assemblies from conductive garbage falling or floating (for
spacecraft electronics) across the traces. Traditionally they've
been transparent to be able to check out (visually) the board
conditions under the coating. Additionally, they've also had
some sort of flexibility to remove the coating to change
components covered by the coating.

If all you want is an opaque coating and don't expect to have
to work on the board again, any ordinary paint will work that
doesn't react with component materials. So-called latex
paints can be sprayed on with a very small gun or airbrush in
enclosed areas. I've used "spar varnish" on both PCBs and
especially for small toroidal inductors with some success; it
doesn't allow rework so it had better test right before coating.

Handyman type stores sell a tool handle coating in liquid form.
When cured it has some flexibility. Most kinds seem to be
opaque. Don't know if it reacts with circuit boards or components,
never tried it on that. A definite insulator on two types I've used
on hand tools.

Perhaps you're looking for what's commonly called potting compound? You might try searching under that name.

Sorry for the confusion, the reason that I am looking for opaque is that I have a circuit board that I have designed that I don't want to be easily reverse engineered.

I was hoping that somewhere there was a conformal coating available that would meet my needs.

I wondered about that. Some manufacturers do things like that.

The potting compound mentioned earlier might be ideal, as it is also
used to "bury" components. Otherwise, test epoxy paints for
conductivity. You could also use a good electronics grade clear
conformal coating, and then the epoxy paint if there is a problem.

Keep in mind that visual inspection is not the only way to reverse
engineer, with enough resources, any coating can be removed, and a
flouroscope or the like could be used.

Keep in mind that any of this will make your unit non-repairable.
Happy trails,

Just be aware that there is a chemical that effectively removes both conformal coat and potting compound without damaging the components. It is a much slower process with potting compound but is is removable as well.

There are several types of epoxy that are much more difficult to remove. The cost more but you might want to consider them as well.

3955. AD9852 / AD9854 DDS instability?

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-06-08 23:58:46 UTC
From: John Miles <jmiles@pop.removethistomailme.net>
Message-ID: <MPG.194d6cd3432d27fa989687@news-central.giganews.com>
Source record: 34978

This question may be related to one that Jan Wagner posted awhile back. Jan was having trouble with excessive jitter (bad enough to be visible on a scope) on the output of an AD9854 chip. I was thinking measurement error was to blame -- and posted as much -- but now I'm seeing something strangely similar on an old (mostly hand-wired) DDS prototype board.

This assembly has been working for over a year now, but recently started misbehaving. Investigation revealed that the AD9854ASQ DDS chip's output was very noisy/unstable:

http://www.speakeasy.net/~jmiles1/98541.gif (10 kB .GIF file)

Looking further into the problem, it appeared that the symptom was sensitive to the chip's temperature (tending to remedy itself as the assembly warmed up), and VERY sensitive to the (single-ended) clock signal level. Raising the clock input level to +10 dBm across 50 ohms cleaned up the resulting output waveform considerably, but it still showed "ears" characteristic of a PLL with degraded phase margin:

http://www.speakeasy.net/~jmiles1/98542.gif (10 kB .GIF file)

The PLL-like nature of these graphs suggested a problem with the chip's clock multiplier. I was able to confirm that indeed, the problem occurred ONLY with the DDS chip's internal PLL-based clock multiplier engaged, with a 10 MHz external clock being multiplied to frequencies between 80 and 120 MHz. With an unmultiplied 100 MHz external clock, the DDS works perfectly with no 'ears', spurs, or instability.

Because of the temperature-sensitive characteristic, I assumed the DDS chip was bad, and replaced it. Much to my surprise, the symptom remained. I checked power-supply connections and bypassing; everything's fine. Noise on both digital and analog Vdd pins is less than a few mV RMS.

At this time I don't understand what's going on with this assembly. It's not a complicated circuit; the AD9854 is a very robust, hard-to-screw-up chip, and in general there's very little to go wrong. I have a good deal of experience with the AD9852 / AD9854 parts, and have never seen this behavior before.

Has anyone else run into this weirdness? Jan, was your problem occurring with the clock multiplier engaged, or did it make a difference?

I think Dan's Small parts still has some various types of MOSFETs.
http://www.fix.net/dans.html

A few years back, I found at a dollar store RF preamps for the FM band, intended for auto use. Curious, I bought one and brought it home. It had a MOSFET inside, I think a 3N200. Since it was only a dollar, I went back and bought all that were left. I don't know if that was a lucky find or not, though the specific unit looked like something Radio Shack was selling. I've yet to get around to trying them, to see if they are any good.

I think some TV tuners use MOSFETs, though I'm not familiar enough with them to know how common or in what tuners or TV sets. Considering it's easy to pull tuners out of TV sets waiting for the garbage, that might be a source of MOSFETs.

I have a number of Delco digitally tuned car radios, and they have a significantly looking transistor for the FM RF stage. I guess I didn't bother tracing the circuit because it seemed a shame to even consider scrapping them. But if it is a MOSFET, that might be a way of getting some MOSFETs, since these are pretty common radios and I've picked them up for five dollars at garage sales and even found some in the garbage.

Other than that, I can't think of common consumer items that used MOSFETs, limiting their availability in scrap equipment.

<< Does anyone know of a cheap substitute for the 40673 dual gate mosfet? >>

Doug-

In my opinion, the only reason anyone would buy a 40673, would be to have an exact replacement.

A couple of replacements I can think of, are the 3N200 and 3N201. I think either may have a better noise figure, but I don't know for sure if they both can be plugged into a 40673 socket and have DC voltages and currents come out right.

3963. 4K filter at 15.42MHz

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-06-09 11:34:30 UTC
From: brmadhukar@hotmail.com
Message-ID: <2c04c006.0306090334.3ec9394d@posting.google.com>
Source record: 34986

Hi,
This is revisiting a problem I had posted earlier. For a GPS RFIC
I have requirement of

a) LPF with cutoff at 30MHz
b) BPF with bandwidth of 8MHz at 15.42MHz

both with I/O impedance 4K ohm. With this impedance the Inductor
becomes very high valued. I had tried to reduce this impedance to
approximately 2K ohms and developed the filter but could not get
proper performance (a loss of 4dB - 6dB in performance). Both filters
were elliptic. Tom Bruhns referred me to some transforms but it could
not really help me in this case as the topology became more complex by
applying this. I am however looking into this to see if some other
configuration could be used with this transforms.

Meanwhile I would like to know any y useful info about, low freq high
impedance LC filters tips/ tricks or anything that is useful.

Thanks,

B R
Madhukar

"W1FB's Design Notebook" includes reprints of a couple of W7ZOI and W1FB
articles that go into considerable detail on the design of Cohn crystal
ladder filters with just this kind of consideration.

Metal can:

3N201 or 3SK45

Plastic package:

BF961, BF981, BF988, 3SK88.

73, Ed. EI9GQ.

Design it for whatever impedance it likes and wind a couple little
transformers.

I bought a dozen BF981s at Cricklewood Electronics the
last time I was in London. My usual mail-order source
for European components is Barend Hendriksen, whose web
page lists all the usual suspects.

The 40673 is a collector's item now, and attracts
collector's item prices...

I'm trying to get a Siemens Level Oscillator W2006 (0 to 17 MHz) up and running. This is beautifully built mechanically, but unfortunately mine's not working electrically and is a bit more complex than the average sig. generator. A schematic and any additional information sure would help. Does anyone have the schematic or manual info on this? I've searched the web to no avail. This unit was made in the late 60's

Thanks in advance.

Harold Johnson's advice is the best.

It is quite difficult to design at a high impedance like
4KHz at frequencies in the tens of megahertz. The effects of parisitic
capacitance become
too great.

Roy, some FYI:

Conformal Coatings are regularly applied to assembled
spacecraft PCBs. These are nearly all see-through types with
no coloring, usually only a dye that is visible under UV. The
purpose there is to keep metallic detrius away from conductive
paths in micro-gravity.

Back around 35 years ago, JPL had authorized only three
compounds suitable for spacecraft use, all silicone based and
all having zero to near-zero outgassing properties; outgassing
could have affected optical sensors on spacecraft among other
things. Those included a potting compound for embedding
assemblies such as "cordwood" structures then considered to
be miniaturization. Things have improved considerably since
the mid to late sixties.

Lately, some PCB makers have called the (usually green) very
light coating on PCBs as "conformal coating" but that is only for
the PCB without mounted components. Component positioning
silkscreening marking is then done over this very light coating.

I think that the conformal coating that Andy is talking about needs
to have some resiliance/flexibility to tolerate slight differences in
component expansion-contraction with temperature. For that
reason I mentioned the tool-handle dipping compound that leaves a
slightly resilient covering on handles. Many drills, taps, dies on
tool supply shelves are also dipped in a similar compound, usually
a clear one to check out the sharp edges protected by the compound.
Both can be removed with a utility knife.

My background is a bit different from yours. In the test equipment manufacturing industry, the green coating on PC boards is called "solder resist" because of its chief function -- to prevent solder from sticking to most areas during the wave soldering process. Without it, a typical board becomes a real mess, with solder bridges and glops of solder where it doesn't belong. It does provides some rudimentary protection against corrosion and contamination, but that's not its primary purpose. Conformal coating, which covers the components as you say, isn't used very often on boards intended for indoor use, unless extremely small leakage currents would cause a problem, or for other special reasons. I once worked for a company that made traffic logging equipment. It was micropower to conserve batteries, and the instruments sat outside -- so moisture was a problem. I recall we had a dickens of a time finding a good conformal coating that wasn't hygroscopic. I've seen potting compound used to conceal circuitry -- and I've cut it off with an X-Acto knife, had it chemically dissolved if too hard for a knife, and had modules X-rayed to find out what was inside. (None of this, I hasten to say, was for the purpose of stealing somebody's intellectual property.) A silicone potting compound was also used for a 30 kV CRT power supply. Without the potting, the field gradient was high enough to cause a lot of corona -- to troubleshoot a supply or do development work on an unpotted unit, we immersed it in Freon.

The handle-dipping stuff sounds like a good solution for some purposes. But now that the original poster has told us the intent is to conceal the circuitry, something harder to remove might be preferable.

That sounds pretty interesting. I've been thinking of homebrewing
a nostalgia receiver, and I haven't figured out an appealing way
to do the conversion oscillators. One crystal per band is easy,
but sort of expensive. I've wondered about using the harmonics
of one crystal for that purpose, which sounds like what you have
done. Could you say a little more about the conversion stragety?

From: g3pho@blueyonder.co.uk
Message-ID: <3ee604a1.21751519@news.blueyonder.co.uk>
Source record: 35002

I wonder if anyone has any information on the Ailtech 7415 Precision Automatic Noise Figure Indicator?

I've just obtained one and am using a Nore Noise Generator head with it, driven by the 28V o/p from the Ailtech. However I can't get the calibration control to work, to set the ENR compensation. The meter is hard over on the left hand side and adjustment of the calibration control has little effect.

If anyone has a manual or even just a circuit diagram I'd be much obliged.

Hi All,

I have been asked by a neighbour if I can build him a small device to allow him to monitor his chicken coupe when he is at home as he has had a lot of chickens stolen.

I have found a few designs on the net and am in the process of gathering parts. My question is this:

Is it possible to connect more than one microphone to the transmitter input circuit and will I need to make any alterations to the microphone input circuit for more than one electret insert to work correctly.

The guy would like to have more than one insert so he can monitor inside and outside the coupe!

Thanks for any hints etc...

It depends a little on the transmitter. Most very simple FM transmitters, if that is what you are using, have a single transistor audio gain stage. If you are using the electret microphones with the built-in FET, (They have a DC power pin) you will have plenty of signal to do a simple resistive mixer, just run each microphone audio through about a 22K resistor to the input of the transmitter. If your microphones do not have an active device built-in, (Only two terminals.) then you may be marginal on gain with this approach, but it is worth a try. If all else fails, you can add a gain stage to make up for the mixing loss. You may also find you want less gain on one of the microphones, in which case just make its resistor a little larger.

Sure seems like it. However, I replaced the loop filter components a couple of times, just to be sure. No effect.

>configuration could be used with this transforms.

A 4 KOhm impedance at those frequencies is unrealizeable.

As was suggested, transformers at each end would work. With
a 9:1 turns ratio, the impedance transformation is 81:1. At a filter
impedance of 50 Ohms, those transformers would convert it to
about 4050 Ohms.

Small toroidal forms with powdered iron mix in the core suitable
for 6 to 60 MHz range will work. The windings can be done with
10 strands of enameled coil wire wrapped together and wound by
hand. An Ohmmeter can determine which strand is what from the
wire bunch. You still have to get the strands hooked up right. :-)

A 5-section Elliptic function, 1 db passband ripple, will yield an
A-sub-min of 69 db stopband rejection beyond first nulls.

If you need a sketch of both filters with 5% tolerance fixed
capacitors, let me know by private mail and I will scan it for you,
return it privately in JPG format.

although Mr & Mrs Mouse don't have much comments on this NG, I've
received very much comments from GW4DGU, SM5BSZ and other, and hope to
have the permission to bring the comments on my site later. As SM5BSZ
says it is always a good idea to forward discussions about problems
with modern receivers

It is also general problems with receivers mentioned, the Linrad is
also discussed in some details

Source record: 35009

I'd use a low frequency ferrite core rather than powdered iron for the transformers. The phase angle of the winding impedance isn't important, just the magnitude. Low frequency ferrites will give you a lot more impedance over the HF range than powdered iron -- the largely resistive nature of the impedance is inconsequential and, because of relative frequency independence and immunity to resonances, often desirable. Commonly available type 43 material or equivalent is a good choice for the upper part of the HF range. You'll get a relatively constant winding impedance over a wide frequency range, and a much greater impedance at lower frequencies than you would with a powdered iron core.

Unfortunately, the transformer solution isn't a viable one for the LPF. Unless someone can think up another solution that works down to DC, or you can tolerate some low frequency cuttoff in your LPF, you're stuck with living in the 4K ohm world. For that I can make a couple of suggestions.

The first is to take another look at the possible transformations. There are usually quite a number of different ones you can use. Look for topologies where you can absorb the unavoidable parasitics. For example, if you're stuck with 2 pF of stray C to ground at some point, look for a topology that requires 2 pF or more of C to ground at that point -- you get the idea.

The second is to look at how circuits were designed and built in the vacuum tube days. They used to routinely deal with high impedances, and developed techniques to accommodate them -- electric field shielding, special inductor winding techniques, ceramic insulation(*), and so forth. In today's low impedance solid state world, these techniques are usually inappropriate, so they've largely been forgotten. But it's the world you may have to deal with, so it would be worthwhile to see how it was done.

Roy Lewallen, W7EL

(*) Actually, in modern times, PTFE (Teflon) is a much better insulation choice than ceramic for many high-Z applications. Because of its low dielectric constant of about 2, it'll produce a lot less parasitic capacitance than alumina, the most common ceramic, with its dielectric constant of about 10.

probably the best thing you could do is copying the 2-B in a way by
starting with a 3.5-4MHz receiver. But remember that what was the most
efficient cost-effective design for Drake isn't optimum for you.
A Japanese copy of the Drake 2-B is supposed to be Star SR-400(?), but
it had a bad reputation and probably couldn't compare with the
performance you had with the 2-B.
In the 1960-70's the japs copied techniques from Heath and other
manufacturers, but often seem to have misunderstood important rules.

So I would use 455kHz IF, but avoid 50kHz if you can't make adequate
selectivity on 455kHz in some simple stages for the next conversion,

instead have 455kHz as the final IF with modern ceramic filters

Rather than copy the 2B, I'd look very carefully at the R4C
design, and all of the various modifications that were later
done to make up for implementation flaws (read that as
"economies").

The 2B got its selectivity at 50kHz with a tunable passband
filter that is not something anybody wanted to try at home in
those day, and still isn't! The R4C uses a conversion technique
to provide passband tuning that works very well and is easy to
implement.

The problems with the R4C design are no different than with any
other triple conversion receiver that gets its selectivity too
far down the IF chain. There are loads of good write-ups
available on the Internet, and a google search will turn up
everything one needs.

>lower frequencies than you would with a powdered iron core.

Roy, no offense, but I've found out (about 20 years ago) that
powdered iron cores can work out just fine and better than
ferrite over the frequency ranges mentioned.

One trick to keep bandwidth wide is to bunch up ALL strands
of wire into a mini-cable, whether 3 strands for a 1:4 or 8 for a
1:49 transformer. The length of the bunched strands should be
at least a quarter wavelength at the highest part of the frequency
range. The toroid core material will handle coupling at the lower
frequencies. A hand drill can do the bunching/bundling of strands.

The test is to accurately measure the transformer characteristics
once done. Few bother with the test...it's wind and go.

>Unfortunately, the transformer solution isn't a viable one for the LPF.

Why not? We don't know yet what the lower bound of the
LPF really has to be, do we? The assumption is that it "goes
to DC." It may not.

Obviously a transformer will NOT go to DC. :-)

But, the bandpass filter does NOT go to DC. A conventional BPF
with Elliptic function response would be a lovely short to the
driving circuit. Doesn't really matter what the "impedance" of the
BPF is below half the lower-side cutoff frequency.

>Unless someone can think up another solution that works down to DC, or
>you can tolerate some low frequency cuttoff in your LPF, you're stuck
>with living in the 4K ohm world. For that I can make a couple of
>suggestions.

No, I won't accept being "stuck with 4K Ohms." It would be best
to examine the driving circuit and the load end circuit to find out
if the impedances CAN be lowered...at least to 200 Ohms or less.

>The first is to take another look at the possible transformations. There

Do some numbers of the frequencies given and the given Z.
Capacitors will come out to a few femtoFarads for an Elliptic.
Some of the inductors would be several microHenries and
probably have distributed capacitance beyond the Elliptic
null resonating capacitors.

>The second is to look at how circuits were designed and built in the

>usually inappropriate, so they've largely been forgotten. But it's the
>world you may have to deal with, so it would be worthwhile to see how it
>was done.

That won't hurt for a general knowledge base.

[yes, I DO remember the Tektronix 545 scope big L-shaped delay
line with several dozen little trimmers along the way...:-)]

The original request was for a LPF and a BPF, both preferrably
Elliptic function in response. We don't know the lower bound of
the LPF as far as application is concerned. We do know the
bounds of passband of the BPF in the region of 6 to 20 MHz
or so. We don't know if a linear group delay characteristic is
needed...which it might to preserve GPS pulse fidelity.

A toroidal transformer can be made with powdered iron core
that can go down to 1 MHz and up beyond 30 MHz at least to
a 1:49 Z step-up/step-down in a 1-inch OD toroidal core. I've
done it. A 1:81 Z change should be realizeable, too, but the
core OD might need to be larger than an inch just to hand-
wind the thing.

I have used two polarised electrolytics in series 'back to back' to
produce a non polarised device. It appeared to work. In fact its still
working in my rotator controller.
I would think that the bridge idea would not be too good due to the
voltage drop on the bridge, if in fact it would work at all.
I'll watch this thread with interest.

Source record: 35016

I've also made a non-polarized electrolytic with back-to-back polarized ones, with the addition of a diode across each one to limit the reverse voltage to a diode drop. (Otherwise you're depending on the capacitor to be much leakier when reverse voltage is applied than when forward voltage is applied.) However, I'd hesitate to pull this trick if reliability was important. And I'd never do it with tantalum electrolytics. Even a very small reverse voltage greatly increases the failure rate of tantalum capacitors. Modern aluminum electrolytics are pretty different from their older, larger predecessors, and I don't know how tolerant they are of reverse voltage. I'd probably still use the back-to-back trick with aluminum electrolytics for a one-off project, but not if reliability was important. Zero reverse voltage would be a more prudent goal.

You can of course purchase non-polarized electrolytics which are roughly twice the size of their polarized counterparts. I don't know how they're constructed. If anyone does know, I'd be interested in learning.

While this sounds sort of right, it does not work. The capacitor simply charges up until on all following cycles the diodes are reverse biased. Think about it.

The two electrolytics in series with reverse charge shunting diodes works, but the life expectancy of the electrolytics is considerably shortened.

Your best bet is a true non-polar, like a motor starting capacitor.

Thanks for the reply Doug,

Yes it is a just a simple FM transmitter and from what the description
says the audio seems to be amplified by a single transistor.

I don't have the parts yet so I can easily get the capsules with a
built-in FET if they will be a better option.

Again thanks for the reply, very useful...

Cheers,

Hi

sorry, I don't have the faintest idea about your skill and ressources,
but I would suppose it is difficult and not very easy to build a
design as it was done in 1961-62 when the late 2-A and 2-B were
designed, and it is much more difficult to find the components today,
but most important is to understand all the different features and
tricks and understand why it is just done as it is, so I can't
recommend you to do it although it may be an easy task for somebody

Hi,
Thanks all for providing much information. I am basically an "elctronics - engineer" who worked on lot of software and recently coming back to "electronics" like designing Circuits, Mixed-signal PCBs ... . I am not aware how transformer is wound for RF and what size these shall be. Do let me know where I can look for such information.

With circuit in hand, I chose Elliptic over other configuarations as it has steeper skirts. The Phase is fairly linear and the actual implementation is also supposed to have same characteristic. Now I am not sure whether it can in practice be maintained.

I think there is electric in there, batteries would run out quite
quickly if it's transmitting all the time.

>or depending on how far away the house it
>he could use a video sender , with just a
>microphone plugged in , you then can monitor it on his TV

The house is about 300M from the shed line of sight and the budget is
very tight. He is retired and lives alone.

>How about just a pair of baby intercoms , that work on mains .
>(ie) the type that TX up the mains cable .

Not sure if the house and shed will be on the same mains line. The
village is split into two, as can be seen when half the village loses
power and the other half doesn't!

>and depending on how much he wants to pay .
>how about a video link , a 2.4ghz video senders
>the transmitter , with a b/w camera fitted to it , and a microphone
>in the shed , the receiver at home .
>and he would be able to watch and listen from his home
>again all depends on how much he wants to pay
>and how far away from the shed he is .

I think the camera idea, although a good one, is a bit ott for the
purpose, and can get expensive. It's too far to run a cable so I think
wireless is the way to go.

>- so don't jump straight in , there are many options that
>can be explored , either by building something or by
>buying something straight off the sheld , or modifying

I've seen a few designs for little radio transmitters that are quite
cheap to make, and offer a more versatile approach, with the ability
for more than one microphone etc...

>make life easy for your self .

I'm trying!! Now to gather some bits together I think and give this little circuit a go.

Thanks for the reply...

Whilst on the subject of Electret Microphones.... (again!)

I posted a topic a short while ago asking about electret microphones which resulted in my receiving a couple of replacements from a kind gentleman in scotland.

I have replaced the insert on the hands free kit and even though it worked the first time I tried it on the rig it has stopped working.

The insert is fine, as are the connections between mic. and radio. One thing I have noticed is that the +8V from the set is feeding into the 'box of tricks' which is then sending about +4.5V up to the mic insert. However when I connect the mic insert to the mic line the voltage drops to about +1.8V and there is no audio.

The insert only has two connections on the back, the same as the one that came out but it seems to be dropping the voltage by a considerable amount.

I can only guess as to why this is as my knowledge of these microphones is very limited. I was wondering if someone may be able to shed some light on this?

Cheers,

Iain M0PCB

> any success with this trick?
> tnx
> hank wd5jfr
==========
A bridge rectifier is a full wave rectifier ,hence its output is polarised.
If a capacitor is required in an AC circuit a polarised capacitor in the
polarised output of a bridge rectifier becomes a non-polarised capacitor for
the AC circuit.
However the electrolytic polarised capacitor is always is series with 2
diodes ,resulting in a voltage drop of approx 1.4 V
If that is acceptable ,the circuit should work.

<snip>

It obviously did not occur to you to plug those numbers into
Google.

http://www.americanmicrosemi.com/products/specs/2N6166.phtml

I didn't find anything on the 6166S. However, it has been my
experience in the past that parts with letters after their numbers like
that often indicate that the part is certified to be usable in specific
(and sometimes critical) applications, such as biomedical or space.

In any case, the 6166 appears to be a mil-spec RF transistor, NPN,
and not particularly cheap either. I saw some Google entries for it with
prices in the USD $80 range.

Good hunting.

Maybe it didn't occur to him/her as the case may be because they aren't that familiar with all the things that can be done online. You can't assume ALL know about google or any other sites for that matter. Just because people get online, doesn't make them computer whizzes or know of every site to be had. People got to lighten up. Why not just answer the question without getting an attitude. They asked a question, not to be insulted. Man, some people sure don't make computer use, user friendly.

"I" do have info on a 2N6166 but not the "S".

It is a 100 watt RF Power Transistor rated at 150 MHz..
NPN Silicon
Designed for VHF Power amplifier applications in military and industrial equipment. Particularly suited for Class AB, B or C amplifier applications up to 200 MHz.

Specified for 28 VDC, 150 MHz
Output Power 100 Watts
Min. Gain 6.0 dB
Eff. 60%

Specified for 13.5 VDC, 150 MHz
Output Power 30 Watts
Min. Gain 4.5 dB

Parallel Impedance Characterization

Max ratings:
VCEO 35 VDC
VCBO 65 VDC
VEBO 4.0 VDC
IC 9.0 ADC
PD 117 WATTS - 0.667 W/DEGREES C.
TSTG (storage temp) -65 TO +150 DEGREES C.

ALL the above comes right out of a Motorola Semiconductor Handbook. There is much more, like graphs and such, but this should answer most of the questions relating to usage and ratings.

I have an HM-95 DTMF mike used with the ICOM 2100H. I want to use the mike in another application, and have the microphone connector wiring diagram.

Applying the 8 volts for the DTMF chip, does not bias the mike element. Adding an external resistor to bias the element, I get audio from the mike, but it kills the DTMF tones.

Anyone with the schematic for the audio input stages for the 2100H ? I'd appreciate a .PDF or a .JPG or even a hand sketch of how in heck they use the thing.

TIA.

HI
If the person has electric in his shed .
it might be better using an intercom , & wire

or depending on how far away the house it
he could use a video sender , with just a
microphone plugged in , you then can monitor it on his TV

How about just a pair of baby intercoms , that work on mains .
(ie) the type that TX up the mains cable .

and depending on how much he wants to pay .
how about a video link , a 2.4ghz video senders
the transmitter , with a b/w camera fitted to it , and a microphone
in the shed , the receiver at home .
and he would be able to watch and listen from his home
again all depends on how much he wants to pay
and how far away from the shed he is .

- so don't jump straight in , there are many options that
can be explored , either by building something or by
buying something straight off the sheld , or modifying
an existing items .

make life easy for your self .

hope the info helps .

HI THERE .

FIRST OF CHECK OUT

http://www.surplussales.com/Manuals/man_kenwood.html
FOR YOUR KENWOOD MANUALS

****
Now I wonder if you have the same problem as some of the older Kenwood
ts440s ? , Some of the older ts440s used to have a problem with the display
, and the keypad operations on the front panel , sounds familiar !!

In brief it seemed to be caused by some sort of protective coating
that was applied to the circuit board , when it got old it would
change its proprieties , and used to absorb moisture
then it would caused a similar problem to what you have
simply because the CPU and the rest of the circuit needs to run at precise
voltages and frequencies , this coating when it was old used to
alter the capactience's and resistances and frequencies of tuned
circuits , and the CPU used to Un-Lock then it used to cause problems

((((check out ts440-faults for a more detailed explanation than , I have
given))).

hope the info helps

direct email to >>>> g7izx.paul@ntlworld.com

hope you get it sorted .

I've seen a designation like this used to denote a part that's selected or more tightly specified, which is along the lines of what you've seen. A large equipment manufacturer might have a need for a transistor with all the specs of a 2N6166, but, say, a particularly high hfe for a particular application. They pay the transistor manufacturer to sort parts and furnish them with only ones having a sufficiently high hfe.

Consequently, I think it would be safe to assume that the 2N6166S meets all the specs of a 2N6166. But there's probably no way to tell in what way it might be special, unless you have access to the internal specifications of the company that ordered it.

I used to buy the 40673 25 at a time to repair garage door openers in
the '80s and '90s. I think they were used in the "Overhead Door
Company" brand of receiver. Lots of the old units must be coming out of
service, so you might ask people who do garage doors for their dead
receivers. The most common failure was a shorted power diode, open
electrolytic, and a burnt resistor, but the MOSFET was still good.
There is a "Overhead Door Company dealer in Ocala that i will check when
i get a chance. I salvaged piles of 6CW4 nuvistors and 6DJ8s out of the

dead tube receivers, and used them to repair a lot of old equipment,
too.

Message-ID: <3EE8F92C.5040406@hotmail.com>
Source record: 34915

Status report:

The radio changing frequency for no reason has been solved, it was a
short circuit in the microphone.

The radio not turning on is solved, sort of. The radio refuses to turn
on when it's supply voltage is over 12V DC, even though the manual says
13.8V +- 15%. I turned down the supply voltage to 12V and it turns on
90% of the time.

The keypad works perfectly now that the supply voltage is turned down.

The radio still dies about 25% of the time when I press the keypad to
enter a frequency, but I've found that if I finish entering the
frequency and turn the radio off and on again or hit transmit the radio
comes back to life.

The radio does not transmit on low power, I only get about 5mW out of
it on low when it's supposed to output 5W, on high I get 15W instead of
the expected 20W.

The radio's receiver works well, and two pleasant QSO's on a local
repeater tell me that the transmitter sounds good on high.

So the radio as gone from dead to really quirky. Any more ideas/help?

Thanks.

73,
Alex

Source record: 34916

Can someone help me figuring out the pin outs of these two YIG oscillators?
HP 5086-7023 2.7-4.2GHz
Avantek S09-1358 4-8GHz
I found there are two coil windings on the HP that are roughly 12 ohm and
1.5 ohm and three on the Avantek one (1, 11 and 132 ohm). The HP YIG has
a straight connector with a total of 9 pins (only 7 are connected).
The Avantek YIG has 8 pin in a circular configuration surrounding the
SMA connector. Pin 1 and 2 have diodes connected to case (ground).
Any help would be appreciated. Thanks.

> The insert only has two connections on the back, the same as the one
> that came out but it seems to be dropping the voltage by a
> considerable amount.
>
> I can only guess as to why this is as my knowledge of these
> microphones is very limited. I was wondering if someone may be able to
> shed some light on this?
==========
There are basically 2 types of electret mike capsules namely with 2 or 3 connections
Most of them have 2 connections ,with 1 connection often but not always bonded to the housing .
This is the negative supply connection with the other obviously the positive supply connection.
The positive supply connection is also the signal out connection.
Because the internal amplifier needs a low voltage power supply (typically 1.5 - 4.5 Volts , no more) a capcitor is required to separate that DC voltage from the amplifier input circuit) The capacitor is typically 1 - 3 microFarad (electrolytic) with its positive connection connected to the electret capsule.
Many radios have 8 - 9 v ,DC available at the microphone socket to cater for an amplified microphone,with or without DTMF encoder.
If you wish to use this supply for the electret mike you'll need to insert a voltage divider with say a 1KOhm and 680 Ohm resistor to reduce this voltage to no more than 4.5 V.
I you wish I can send you (as an e-mail attachment) the schematic diagramme of an amplified mike
circuit incorporating an electret capsule ,as published in QST -December 1991 , page 27.
There are also various schematics re FM Wireless Mikes using an electret capsule . A good site for that is Harry Lythall ,SM0VPO 's website (search for SM0VPO)
Hope this helps.

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday June 15th 2003
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society

>the AC circuit.
>However the electrolytic polarised capacitor is always is series with 2
>diodes ,resulting in a voltage drop of approx 1.4 V
>If that is acceptable ,the circuit should work.

Frank,

Actually, it seems like it should, but it doesn't. Consider this: Connect a non-polar capacitor from an AC source to a load resistor. With each half-cycle, current flows to the load depending on the capacitive reactance at that frequency. The current through the capacitor reverses at every zero crossing.

With the diode bridge, the voltage across the capacitor is unidirectional. The capacitor draws current briefly during the first few cycles, but there is no DISCHARGE PATH, hence the capacitor charges up to the peak voltage, and after that NO CURRENT FLOWS because the diodes are reverse biased. Try it.

Draw the complete circuit diagram. For each crystal insert values of L,Cs,Cp and R. Also values of L,C and R of any other associated components.

Insert everything, including frequencies, in your network analysis computer program, hit the start key and it's done.

The big question is how will you know whether you get the right answers ?

Exactly. And the way it shifts the phase is by current flowing
between the cap and the inductor, sometimes charging the cap and
sometimes discharging the cap. Discharging is not possible with a
diode bridge between the cap and the inductor.

The capacitor simply charges up through the bridge, and sits there, and holds
a charge, and does nothing useful! How do you extract energy back out of the
caps through diodes that are now reversed bias??? The circuit can't work,
and was probably one of the 'spoofs' in an April ham magazine, just to see
if anyone was paying attention.

I love it!!!!!

Isn't that what's inside a cap marked "non-polarized"? That's what I've read.

Dick

4035. frequency of light angstroms to mhz

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-06-13 22:44:41 UTC
From: hexter@blazenet.net
Message-ID: <vekkupna833u51@corp.supernews.com>
Source record: 34937

If an LED is said to be operating at 540 angstroms, how many million mhz is that? If I shift the light output by 10 Ghz would I visibly see a differant color, or is the shift to small to be detected by the human eye.

Also, anyone know of a published specification for the sensitivity of the human eye in total darkness? I guess I would be looking for an answer in terms of fractions of a watt per square centimeter, or perhaps square inch.

Thank-you for any information you can provide.

I think he was a bit lucky in his endevours, however,

Most professional glass cutters will score glass with a cutter soaked in kerosene, and you can get away with some unusual things with glass while submerged. The 'snapping action' of the separation of glass into two separate pieces sends an ultrasonic shockwave across the plane of the glass, and this is what causes the 'shatter' to occur. When submerged, there is a far suppressed shockwave, and the glass just tends to let you 'nip' pieces out of it. I have drilled holes in glass with a normal drill bit while submerged in water.

All I remember is that they won't oscillate at all unless there is current
in one particular coil, but I forget which. You need the normal B+, and ground
for the electronics, and you need 'coil current' in one coil. 80 ma. seems
familiar to me, but check using Yahoo or google search, because it may only
be 8 ma. I don't want you to toast the thing.

Not only can the leter at the end be a selected component, it could mean the
type of package. I did not see the S version in my book. It could be a
Stud mount ?

Doug , Tnx for your response . You are right ,no current can flow in the
direction causing the capacitor to discharge (partly).
I have learnt again
Tnx

The original circuit used germanium transistors. I think they formed a sort of relaxation oscillator, the output was an asymetrical square wave as I recall.

From http://www.electro-optical.com/whitepapers/candela.htm

Typical levels of Luminance and Illuminance

(For a luminance factor of 20%, average reflectance of a typical scene)

Outdoor Illuminance (lux) Luminance (cd m-2)
Bright sun 50K - 100K 3K - 6K
Hazy day 25K - 50K 1.5K - 3K
Cloudy bright 10K - 25K 600 - 1.5K
Cloudy dull 2K - 10K 120 - 600
Very dull 100 - 2K 6 - 120
Sunset 1 - 100 0.06 - 6
Full moon 0.01 - 0.1 0.0006 - 0.006
Starlight 0.001 - 0.001 0.000006 - 0.00006
Indoor Illuminance (lux) Luminance (cd m-2)
Operating theatre 5K - 10K 300 - 600
Shop windows 1K - 5K 60 - 300
Drawing office 300 - 500 18 - 30
Office 200 - 300 12 - 18
Living rooms 50 - 200 3 - 12
Corridors 50 - 100 3 - 6
Good street light 20 1.2
Poor street lighting 0.1 .006

At the threshold of vision the dark adapted observer can see a flash if it
contains on average 90
photons at the cornea or 9 at the retina. This is equivalent to a candle at
30 miles on a clear night.

Frequency = speed of light / wavelength

angstrom = 10 to the minus 10 meters (10^-10)

Do the math.

BTW, the visible range is roughly 7000 to 4000 angstroms. Your LED at 540
angstroms would not be seen by human eyes. Perhaps you meant 540 nanometers
(5400 angstroms)?

>>
First of all, the visible spectrum ranges from 400 nanometers (violet)
to 700 nanometers (red). 1 nanometer is the same as 10 Angstroms.

The wavelength equals the speed of light divided by the frequency
or: lambda = c / nu although you need to watch your units carefully.

This corresponds to 7.5 x 10^14 (violet) to 4 x 10^14 (red) Hz. In
this range, wavelength is used far more often than frequency, which
would be in hundreds of TeraHertz.

10 GigaHertz would be trivial.

Happy trails,

I would recommend searching for a program called RFSIM99 which is a free windows 'S' parameter simulator program that I find very useful.

It can also do Monte Carlo tolerance analysis which helps to see if any parts are critically sensitive. This is a great way to see if a circuit will be easy to get running or a finicky critter.

==========

There is another program that is often suggested as a replacement for the ARRL Radio Designer program. Unfortunately I can't remember which one it is, but I understand that it is better and easier to use than the ARRL Designer which is part of why they no longer sell the ARRL Designer.

Perhaps somebody online can tell us which program it is. I think there is a free version for home use....

Ansoft's Serenade SV. I wouldn't call it easier to use than ARD, but
more powerful. It will read ARD files however, since both programs
are originally by Compact software.

Yes, it's Serenade SV, which I have.

I was just interested in trying out the ARRL Radio Designer as well, to see how well I got on with it.

On this topic , I would like to use part of a glass bottle or jar as a
'chimney ' for a RF Power Valve (tube).
This requires the bottle or jar to be cut removing its bottom and neck.
Has anybody on this NG done this (probably for a different reason) and how.
Note : I have heard that 'official chimneys' are made of pyrex glass, best
suitable for high temperatures .
As an alternative I could try making a chimney from teflon sheet as used in
the kitchen for frying food without a fatty substance , however that type
of teflon sheet is rather thin (only 0.15 millimetres = 0.006 inch) to make
a sturdy cylinder serving as a chimney.
Any advice will be much appreciated.

It is no problem to remove the bottom and the neck of a bottle.

Take a piece of wooden thread, wrap it around the bottle where you want
to make the cut, then soake it with methylan (alcohol) and set it on fire,
at the time when the fire stops then put the bottle under cold water and
it will snap where the the thread is.

I am not sure if you are familiar with the heatherlite/mobilite hands
free mic. assemblies, but that's what it is. The voltage out of the
box to the mic insert is about 4.4V+/- with no insert connected. When
I connect the insert the voltage drops way down. I am not sure why
this is.

>Many radios have 8 - 9 v ,DC available at the microphone socket to cater for

As I say, there appears to be a voltage divider circuit built into the
heatherlite mic. box, as the voltage out to the insert reads about
4.5V ish... I'll go back to t and do some more "poking" around!! :-)

>I you wish I can send you (as an e-mail attachment) the schematic diagramme

Iain-

What is "way down"? I would expect this circuit might drop to around 1.0 to
2.5 volts DC. The AC voltage output might be millivolts, so the DC voltage
could be relatively low.

Not to be insulting, but is it possible you connected the mic insert backwards?
I understand some have the minus lead connected to the metal case, but some
have the positive lead connected to the case. I would suspect this if there
was absolutely no output from the microphone.

Getting back to your original question, you certainly can have two microphones,
although a buffer amplifier or isolation resistor from each may be required.
However, you have to get one working first!

One photon.

>What detectors are availble at a reasonable price for home experiments?

Not sure, I can across a web site earlier this week that had detectors that can detect just one photon, or at least that's what it said, god knows where it was though, I've since cleared out my cache :(

I find it weird though, at what frequency do radio waves become photons ? ... assuming the scientists have figured things out ok, though some say light ways are not photons and are still waves, guess the debates still out.

Anyway.

>Does it ??

It's not so much "cutting" as "chipping"; basically, the water keeps the
little chips from flying off into the environment (and your eyes).

Immediately after I read that article, I used the technique to "cut" a
circle (probably started with a hexagon or octogon) for a flashlight
whose protective glass had been broken. It worked, and I used that
flashlight for a number of years thereafter.

They're basically a pair of scissors for cutting sheet metal, long handles (15") and short (3") sturdy blades. One type is known as "Aviation snips" in some parts.

>How can the detector tell if it's only one photon or more. Does theory
>provide for fractional photons?

That I can't say, I'm not up on the theories tbh.

I guess it could be just an image intensifier at a guess ... an incoming photon hits a charged barrier made from various chemicals, this barrier then emits a burst of photons onto the next layer - triggered by the incoming photon.

The number of photons emitted by the charged barrier is I guess consistent with the number of incoming photons (1 in, 100 out as a pure example), in so doing makes it easier to work out how many incoming photons you have - no need for a super duper one photon detector.

That's my guess anyway.

Probably completely wrong though lol.

But that's how image intensifiers work anyhow.

As for fractional photons, I don't think their theories allow for such things.

It isn't always easy between English and English. ;-)

Between English speaking countries there are some significant
differences in wording, spelling, and pronounciation.

In the US, some differences between regions and subcultures.

If you use quantum mechanics, photons and waves are "duals" of each other and can be used interchangeably as necessary. It is more convenient to do the math for photons for photodetectors, but you could write the wave equations if you wanted. There is no exact point in frequency that you need to go from waves to photons to get the right answers.

A classic homework problem in 1st year quantum physics is to write the wave equation for a car.

Some hams over here use Pyrex glass chimneys for Coleman gas camping lanterns
for tube chimneys. I don't know if you have them available there.
They come in a couple sizes, one works well for a 3-500Z.

Always easier to work with off-the-shelf components.

The lantern parts are fine with heat as well.

Actually you could represent radio waves as photons, even at VLF! The dual nature of light as photons and waves applies to ALL electromagnetic radiation, which is what light IS!

Now if waves are photons and photons are waves and photons are particles this leads to some interresting stuff. First it seems that photons DO have some mass, or at least a mass equalivant. Does this means that when you walk through a door you emerge on the other side as a difraction pattern? Maybe!

There are several ways to deal with glass. You can cut sheet glass
with a wet saw tile cutter, just go slow. I needed to cut a circle out of
thick glass (3/4" thick plate) to make a blank for a telescope mirror.
I made my own circle cutter out of a wooden disk (cut out of particle
board with a router) to which I put a 1/2" carrage bolt in the middle to
chuck it in a drill press. I wrapped a piece of 3" wide thin steel around
this disk and cut 4 triangle 'gaps' in the metal. It is held to the
disk with screws. The glass is put on the drill press table with a piece
of homasote fiber board between it and the table. The cutter
is run at the lowest possible rpm (190rpm on my drill press). Water and
number 80 carbo does the cutting, a dam of plumbers putty or play dough
on the glass keeps the slurry on the work.

Took about a half hour to cut through the 3/4 plate.
I made two 7" dia glass disks this way.

> You SURE that wasn't the April issue???

The glass does not cut like sheet metal. At best, the tin snips can
only cut little bits at a time.

The cutting, snapping, or other deliberate breaking of glass is best
done under water. As someone already noted, the water (kerosene
works okay too but much more expensive) slows down broken-off
glass pieces, is a much safer medium to do it in than in open air.

A Dremel "Moto-Tool" or equivalent is a good instrument to use to
both score glass for snapping off in straight lengths or to make the
medium-size holes in glass. A variety of caborundum tool bits are
found with Dremel accessory racks at do-it-yourself stores. I'd
suggest working with plastic photographic trays to hold the water
and the work (use a backing piece under the work). A variable
autotransformer might be handy since Dremel and equivalent tools
are high speed: Water tends to get very bubbly with high-speed
tools and it is hard to see where the tool is relative to the work.

>> program, hit the start key and it's done.
>>
>> The big question is how will you know whether you get the right answers ?

One place for answers on internal R and C1 of quartz crystal units
is the Frequency Control Division of Corning. They have, under
their "Obsolete" web page, a number of graphs of those two internal
values over frequency, min-max, for most of their crystal units.

www.corningfrequency.com/obsolete.htm

Look for files starting with "C1_graphs..." or "Rmax_graphs..."
and select for the holder type given in filename.

Or, if you prefer the catalog, go to

www.corningfrequency.com/crystals.htm

The quartz crystal catalog is a 2.1 MB PDF file but the graphs
mentioned are links, can't be grabbed if off-line and your software
does not automatically grab the line and dial up.

Once you have C1 (usually in femtoFarads), you can calculate
the equivalent inductance from the series resonant frequency.
Rmax (series R) will then determine the equivalent Q of the
resonator.

A problem is the Co value. Corning gives many of its units a
value of "less than 7 pFd," not a firm bit of data. A better guess
at the parallel capacitance would be from a frequency counter
measured test oscillator adjustable to less than a percent, set

up to "look" for parallel resonance relative to the series resonance.

Considering that a series resonant circuit is inductive above resonance and, knowing the C1 and calculated L, it is a matter of calculation to determine Co from an accurate parallel resonance. Note: All who get their own data this way need at least 8 significant digits in their calculators and the frequency counter should resolve at least 10 Hz for 10 MHz crystal units.

Hi. I'm in UK.

I've got this hand-held radio. It runs off a 9.6v Ni-Cad battery that clips onto the radio proper. You have to slide the battery onto the bottom of the radio proper from the side. The battery slides into two grooves and there is a pip at the top of the battery that locks with a metal strip protruding from the bottom of the radio. I suspect this kind of battery fitting arrangement is pretty common. Anyone know it's proper type description?

Anyway, you shove a plug from the charger into the side of the the battery. I thought that when charging the battery and the battery was connected to the radio, I would be able to operate the radio, but you cannot. I think that is because the voltage is too high. The charger open circuit kicks out about 17v.

Anyway, there are two things I'm seeking:

Has anyone got a dud battery that will fit my radio? I want to empty it's contents and solder two wires to the contacts so I can power the radio from either a 9.6v power supply, or a made-up battery pack (I'm wanting 2300 maH capacity rather than 700 maH at present).

Secondly, can I buy a power supply for the radio, I mean something like a base unit that I slide onto the radio? I presume you can buy battery charging base units, but I need a power suply unit so I can run the hand-held off the mains.

TIA.

Rich

Yep. It's actually a marine radio that I got for receiving.

From the picture it looks as though it might be a re-badged Icom Marine set.

If it is then I may have one kicking about somewhere and also a multi-way
drop in charger.

I will have a look when I get a few minutes.

Rog.

Well, as well as Swiftech on it, it might also be known as Silva Star.
Whatever, it is made really well. Looks like a cast metal body.

Was terribly dissapointed when I could not run the radio from the
battery when it is charging. :c(

Of course, I can charge the battery with the wall charger, but to get a
dud battery so I can run the radio off a homebrew PSU or a homebrew
battery power pack is what I'm after. Or, as mentioned, a base unit
that can run the radio (as oppossed to merely charging the battery),
but I'd be still after a dud battery. I only get 2.3 hours use of the
radio with the supplied battery, and that's on receive. Will get an 8
AA cell battery holder so I cam make up a battery of NiMh cells
giving about 200 or 2300 maH.

I'm not sure I understand or believe that tinsnips under water will cut glass but I'm willing to learn.
Glass is not a solid per se but a super cooled liquid.
I you lean a long piece against a wall it will sag over time...
A glass cutter has a very sharp point that scores the glass if enough pressure is applied..
The "scratch" is a stress concentration and the glass will break along the score line if stressed further..
The breaking stress should be applied as soon as possible after the glass is scored..
If you wait the stress caused by the scratch will diminsh as the supercooled liquid seeks equilibrium..
Now will someone educate me on how tinsnips underwater work!

rec.radio.amateur.antenna,rec.radio.amateur.dx,rec.radio.amateur.homebrew,rec.radio.broadcasting,sci.electronics.design

hi,

i want to check the output power of an fm transmitter, and i don't have a wattmeter. most of the wattmeters available in market here have a range of
0-50watt or 0-100 watt.
i want to design one, with a range of 0-2 watt approx, using the components available with me - digital multimeter(V,A,ohm), diodes, transistors, resistors and capacitors. someone please suggest me a design or point me to a schematic.

i am very much interested in designing a low power fm transmitter, yet all that i hit upon while searching the net are readymade schematics, which ofcourse work, yet i do not get the real idea of how it was designed. is there any good document about how to design an fm transmitter from scratch, given that "i need to transmitt an fm signal at 90Mhz with an output power of 2 watt". i would like to know how to design circuits for oscillators, pll, power booster, amplifier etc. and how to tweak them for getting the desired output.

please don't worry about the output power(2 watt as i mentioned). i know it's illegal, and i am not going to cause any damage. i just want to learn how to design. let me mention that i am very new to this subject.

thanks.
anand saha.

Yes, I see that now. Thanks.

Points:

Yes, I would imagine that you are right, that battery holder will be
just like my Ni_Cad battery pack, inasmuch as it will clip on.

Pity that I cannot get something like that that will hold 8 AA NiMh
batteries. I wonder if you can get holders that will take 8 AA. That
would be perfect, and perhaps the ideal battery solution. I must make
equiries/do some research.

Posibly I can get a duff Ni-Cad battery pack for next to zilch. Then I
use it as a connector to the radio with a home made battery pack or PSU.
I still need a PSU arrangement.

The site lists an AA batt pack for 15 pounds, which you could adapt as
mentioned.

The site also lists a 12VDC accessory cord, which means there is some
way to feed the radio external 12VDC.

If the radio is some flavor of ICOM, it will have a 2.1/5.5mm coaxial
power connector usually on the top, center pin positive. This is a
very popular size connector, or you could buy cords already made up.

Using the 6xAA pack with throwaway lithiums would give you a
relatively large amount of power, and independence from mains power
for charging. And nearly forever shelf life. All these would be nice
features if you will use the thing in a marine application where
safety might be important.

Anand-

You protest too much. This is a Ham Radio forum, so mention of a 90 MHz transmitter is like waving a red flag. Few will believe that you don't intend to transmit with it.

Are really trying to learn, or are you trying to get us to do your homework? Measuring low power may be as simple as using a diode detector to measure voltage across a 50 Ohm load, and calibrating the meter scale in watts. As a designer, you should be able to figure it out!

If you are serious, why not become a licensed Ham Radio operator, and design equipment that is legal to use? You can find a lot of interesting information at http://www.qrz.com, and even practice taking a Ham Radio exam at http://www.qrz.com/p/testing.pl.

I don't understand this radio when it comes to working it off a mains
PSU.

On the side of the the Ni-Cad battery pack, not on the radio itself, is
a coaxial power connector. Next to it, it says "CHARGE/EXT.PWR. So,
you think that you can plug the wall charger into this socket and run
the radio off the mains, as well as I suppose charge the battery.

Well, you cannot. You get funny results with the radio when you do
that. Besides, it's not good surely to plug the charger into the
battery whenever you want to run the radio off the charger. You would
surely end up messing up the battery charging.

So, assuming that you cannot plug the wall charger into the battery and
run the radio off the mains, how do you run the radio off the mains?
There is no other way to get DC into the radio.

The only thing I can think off is that the charger puts out about 17v,
so you cannot run the radio from the charger, but if you supply anywhere

between 9 and say 12v into the socket on the battery you can run the radio. But that sound iffy, or maybe not. The text right next to the socket on the battery says, "CHARGE/EXT.PWR"

I just don't know how to run this radio off a PSU.

I must ask the supplier.

4095. MSP430 MOrse generation software

I've got that exact kind of thing. And the plug end is exactly the same as with the wall charger.

Somehow, plugging in the wall charger to the socket is not an acceptable way to run the radio of the mains. The radio balks at that. But, if I were to connect the cord to a 12v battery, then the radio will not act up, and will operate okay. And I suppose the 12v in does not charge the battery.

As I say, all I can think of is that the 17v from the charger charges the battteries, but the radio balks, but 12v in, the radio works okay, but the batteries do not charge.

Am going to put radio to a 12v source and see what happens.

> with most of the cheaper PSUs

Yep, having the current does make a lot of difference.

I'm running the radio off a Farnell double PSU that's big and heavy, but max current is only 500mA. When I key the radio the voltage drops to about 7v and the current shows 600 mA. Obviously the PSU cannot cope when on transmit. Interestingly, the radio locks on transmit, probably not enough current so that when I take my thumb off the PTT, relays don't revert the rig to receive.

Am now in the market to buy a 12 or 13.8v PSU with a fair bit of current margin. 2A or perhaps 3A should do. Transmit curent is supposed to be 1.2A.

Are you saying that you can't recieve when the charger is hooked up? Or are
you saying that you can't transmit when the charger is hooked up?

Very few handheld chargers will supply enough current to operate in transmit
mode, but any should allow you to leave the radio on, in recieve mode.

Your charger may be the exception to the above, it may be just a trickle
charger, just putting a slow recharge into the battery. That way you could
leave the radio on the charger 24/7 unitil it was needed, then run off the
fully charged battery.

The 12v adapter that the site you got it from offers should be a high
current source, allowing you to run off of it, instead of the battery (it
will source as much or more current). It isn't a matter of voltage level, it
is more dependant on the amount of current flow as to operating it.
thanks, John.

You could try a 6AQ5, which is NOT pin for pin replacement, but is a
real nice tube to work with.

6C5 6C5 IS NOT even close!!

6C5 probably would work if it had a few more grids, and maybe a differant
base. Next guess?

Well, actually I want to take the radio to hol's where I can run it off
mains. So, I may just buy or make a 2.5A or 3A supply. Weight.

Do you have any schematics for an RF probe? There are schematics out there for an RF probe which you can use on a VOM. You read the RF voltage on the output and use the formula P=E - squared / R (which should (in most cases) be 50 ohms - a standard dummy load). It will give you a ball park idea. Accuracy? Well, I've found it close enough for my uses and experiments with Wattmeters also have shown a close proximity.

Start out with a higher scale, say 40-50 VDC so as not to overload the meter. Can work down a level or two depending on voltage measured. I have an RF probe in my tool box to use on my VOM just in case I need to measure the RF voltage to get an idea of output, should I not have a wattmeter or dummy load with me. Even checking with the existing antenna, will give you an idea

of output.

An RF probe utilizes a diode, a cap or so and resistance. It may be frequency limited, so you have to watch that. The schematic will usually give the range limit, usually to 500 MHz. I've made a few with RG 58 cable, perf board cut to size, and a piece of aluminum tubing cut to size and drilled as needed. About $7 in parts and 1/2 hours work. Most of the parts may be in your junk box or found at Radio Shack.

Right, this is just a "design experiment." Except that you have a
particular frequency and power in mind, and you know it's illegal.

Why didn't you make the subject line, "Help me build an illegal
transmitter"?

I hope no one else aids and abets this activity, I sure won't.

Hi Anand,

Your first problem is one of available voltage. Available from the transmitter, across the load, for the diode to then rectify and present to a meter for display. At 2W into 50Ohms you can at best develop:
P = E² / R
2 = E² / 50
E² = 2 * 50
E = 10V
This is far and away more than enough voltage to make the diode sing, as long as you use this meter AS the load. Trying to design a Wattmeter like an Amateur SWR meter (which is more versatile) would

lead to a design that attempts to use as little power going to the load as possible. You don't ask for that, so the Meter, AS load is appropriate, but then you need to ask yourself how much your real load appears to be like your Meter AS load (frequently not much at all).

Very few antennas offer a load of 50Ohms, which is simply the conventional value engineered into a system (your simple transmitter barely qualifies, and yet at some point it does have an output impedance and is driving a load of some input impedance - a system).

You should then build your Meter AS load with a value you can trust to be close to the actual value. For a ground plane style antenna this varies between 35 Ohms (with a flat radial design with around four spokes at 90° to the radiator, or 0° to the horizontal) and 50 Ohms (those same four spokes drooping at roughly 45° to the horizontal); or 70 Ohms for a dipole (vertical or horizontal) as long as they have been tuned to resonance (and now we return to the flexibility of the SWR meter which would allow you to determine this, but would be starved for power with only 2W available). Simple formulas for frequency and wire required to design these variations abound and you probably could trust them to be close enough. Download the free version of EZNEC and you will find them all and certainly within the means of the limitations imposed (for being free software) to determine those lengths for your self, to the materials at hand.

As for the detection portion of this we start with a 35/50/70 Ohm resistor. Connect this across the output of the transmitter (its antenna output connection and the chassis/ground or power supply common which is frequently the negative pole of the battery or lead of the supply).

Some cheap transmitters expect you to simply connect a whip to it and ignore that this point is also hot with supply voltage. As a precaution, insert a capacitor (one of the small disk types with a value of 0.001µF to 0.1µF) between that connector and the resistor. This capacitor will be invisible to the transmitter and the load (it won't matter).

I presume your meter is a solid state model from Radio Shack, but it could as easily be one with a needle that moves with input (probably found in a receding glacier). Either way, connect the negative lead to the common/chassis/ground described above.

Parallel connect an 1000 Ohm resistor (not critical - could be 620 or 2200) and another disk capacitor (not critical - like the one already described above) across the resistor. One side of this combination should go to the common/chassis/ground described above. The other side should go to the meter's free lead (the positive one).

You now have a lot of connections to common/chassis/ground and you have the 35/50/70 Ohm resistor being fed through a cap on one side (make sure the resistor can take 2W) and the meter with its circuitry

(specifically the +lead) isolated from it. Add a diode between these two points and you are complete: Resistor Load - Diode - +lead.

Apply power, measure voltage, apply Ohm's Law.

Let's see, now, he wants to learn how to design an illegal transmitter, and
the existing readymade designs are no good to him. He wants a fairly
sophisticated design (pll). He wants us not to worry about his power level.

He's posting from a free account.

Anyone else hearing alarm bells ringing?

Assuming you know the value of the transmitter load resistance.

With the diode (preferably germanium or other low-forward-voltage diode) rectify the RF voltage across the load, bypass the RF component of the DC volts down to transmitter ground with a 10,000 pF capacitor. Connect a 2M-ohm 1/4-watt resistor across the capacitor.

With the high resistance digital voltmeter measure the DC volts across the capacitor. The measured DC voltage + diode forward volts will be equal to the PEAK RF voltage across the load.

Transmitter power output in watts = Squared(Peak RF Volts)/2/Load resistance.

The above circuit will work up to a measured DC voltage not more than the rated reverse voltage of the diode.

Not sure about alarm bells at 2W., although I concede there's still a
possibility for mischieve-making at that low power. What's actually on
90Mhz? Might give us a clue...

Wes

Lighten up a little, have you never had a class assignment in your life.
Lets at least cut the guy a little slack.
With a little help in the subject this novice may go on to become a great
engineer, at least he's interested at this point.
Why are you so afaid that someone might give him information that is readily
available online??

There are worse things he could be doing with his time !!!

Ricardo,

I have several Daiwa cross needle meter movements. They are $7.50 each plus shipping. The scales are 2KW forward and 200 watts reverse and the VSWR scale in the middle.

If you are looking for a quantity, they are manufactured in Japan and it may be Daiwa that makes them. If not, I can probably find the manufacturer.

Regards,

Alan - K6RFK

Paul, 88-108 MHz is the U.S. FM broadcast band.

HOWEVER, he also said he wanted a PLL design. You don't use a PLL design
for a single-channel transmitter. You use a PLL design for a synthesized
transmitter, that can go ANYWHERE in the band.

I can think of a few interesting things I could do with a 2W synthesized
transmitter. Running a pirate radio station is only one of them.

The space between 89.9MHz and 90.1MHz on the commercial FM broadcast
band.

Okay.

I just don't know how it's done.

Put 17v into the socket at the side of battery and it charges the
Ni-Cads. Put 13.8v or 12v and battery not charged. Must be diode in
that battery pack.

Rich.

Yep, 6CU5 is the one. In your defense, there are other *C5s that
are like the 50C5, e.g. the 12V version is the 12C5/12CU5. It's one
of those cases where the 6V version of a tube number is different than
the other-volt versions (as I discovered when I bought some 12L6s
sight-unseen years ago, thinking how clever I was!).

Nah! 6C5 is an octal audio triode.

50C5 is a typical AC/DC audio output tube common in the 1950s
etc.

Prob looking for something with 7 pin base?

I have just been informed that Trace Inverter Company will not give support to any person who wishes to sevices their own equipment. You must send it into the service center and pay someone else to do the necessary repairs. I have a Trace TS (Tiger Series) inverter which I wish to repair and only requested a schematic. They seem to be so afraid of somone stealing some design secrets that they will not help.

I for one will think twice before using any of their products in the future

It has been my experience that the ones most affraid of someone cheating them, are themselves the ones most likely to cheat. I wonder if that holds true with companies too. Can anyone out there help me in locating a schematic? Will gladly pay all reasonabie costs. Please respond to my email address Thanks Don Smith

Its a matter of liability. If they help you do a poor repair job and
someone gets hurt, they can be sued for millions of dollars. No one who
makes inverters or large power supplies passes out the information
freely. Go ahead and buy a different brand, then try to get a manual.
Good luck tilting at windmills.

Hi.

You want a free Noise Figure calculator windows proggy and would like to try out a beta version here you go ...

<http://www.nospagetti.co.uk/receiver_nf.zip>

I think I still have a problem with the formulas but let me know if you think I'm wildly wrong :)

I'm fed up with drawing things out on paper and going thru it all on a calculator so I thought I'd try to make it somewhat easier for myself.

Thought I'd release it as freeware as well incase it holds any interest for anyone else.

Sorry theirs no help but all you do is right click on the design area to add/delete, left click the blocks to edit them.

I might release the source code as well, will wait till I got things right.

Regards

Clive

Oh yeah, I forgot, IF he is using a dummy load or an antenna short of required length such as for a low power "Carrier Current" type Radio station of an FM variety, he would be completely legal. He didn't really specify his end result other than learning. For all we know, he could end up on a frequency where no license is needed anyhow.. And if so, what is the big deal? Two watts max FM, isn't going to do a hell of a lot. L.

You can say that again! The flood gates have been opened long before this guy happened by. At least he admits to his actions and seems to understand any consequences. If he is using it to learn as he says, and isn't planning to cause RF interference, more power to him. At least he is honest about it.

D'oh!
I can't believe I didn't clock that. It's the same here in europe. All
the major broadcast stations. Sheesh!
:-(

This end of the FM band is traditionally set aside for Schools. The
FCC explicitly describes some transmission modes as being dormitory
oriented (although not at 2W). I am a longtime listener of KEXP/KCMU
90.3MHz. The KEXP is a vanity call linking it to Paul Allen's EMP
music pavilion (more than a shrine to Jimmy Hendrix). KEXP is one of
the leading internet broadcasters with community volunteer DJ's and
nearly 30% of their operating revenues covered through internet
pledges. In fact, the Seattle area consistently shows in the top 10
of popular internet broadcasters (3. KING classical, 6. KPLU jazz).

Has this idiotic sueing thing really gone that far? I think that means
there should not be schematics available for any equipment at all, which
is clearly not the case. Anyway, would not a disclaimer in the service
manual be enough to circumvent this?

I am more inclined to go with the 'proprietary crap' explanation of this
phenomenon.

Met vriendelijke groet,

Maarten Bakker.

In my haste, I improperly stated a thought. It should have read "or a short antenna (required length or less) such as for a low power "Carrier Current" type radio station......."

Any one familiar with CC stations should know the antenna has to be kept a certain maximum length to limit radiation of the signal. IF that requirement is met, then they are in compliance - with no license needed. If memory serves me correct, I believe it to be 10' maximum. Seems to me too, that the figure also included the feed line.

One more thing, what is the big deal if he was posting from a "free account". Big deal! Sorry, but that party said or appears to have done - nothing - to warrant a federal case or spark a major concern. As Gerry pointed out, illegal amps and radios are a dime a dozen. You can find them most anywhere - hamfest, internet, you name it. This person's research is peanuts compared to the real situation.

On Sun, 15 Jun 2003 08:56:44 -0500, Henry Kolesnik <wd5jfr@oklahoma.net> wrote:
> Glass is not a solid per se but a super cooled liquid.

Myth. From an old post:

see: http://www.google.com/search?hl=en&q=glass+liquid+legend

Such as:
http://www.ualberta.ca/~bderksen/antique.html
which also references:
http://www.ualberta.ca/~bderksen/florin.html
and see also:
http://www.urbanlegends.com/science/glass.flow/origins_of_claim.html
http://math.ucr.edu/home/baez/physics/General/Glass/glass.html

And from Science News, Vol. 153, No. 22, May 30, 1998, p. 341
http://www.sciencenews.org/sn_arc98/5_30_98/fob3.htm

''Edgar Dutra Zanotto of the Federal University of Sao Carlos in
Brazil calculated the time needed for viscous flow to change the
thickness of different types of glass by a noticeable amount.
Cathedral glass would require a period "well beyond the age of the
universe," he says. ''

'''"At first, I thought that the [sagging window idea] was a
Brazilian myth," Zanotto wrote, but he soon learned that people all
over the world share the belief. Repeated in reference books, in
science classes, and recently over the Internet, the idea has been
repeatedly pulled out to explain ripply windows in old houses. "For
the layperson, it makes a lot of sense," says LaCourse.''

''The study demonstrates dramatically what many scientists had
reasoned earlier. "You would have to bring normal glass to 350?
Celsius in order to begin to see changes," says William C. LaCourse,
assistant director of the NSF Industry-University Center for Glass
Research at Alfred (N.Y.) University.''

''The origins of the stained glass myth are unclear, but the
confusion probably arose from a misunderstanding of the amorphous
atomic structure of glass, in which atoms do not assume a fixed
crystal structure. "The structure of the liquid and the structure of
the [solid] glass are very similar," says LaCourse, "but
thermodynamically they are not the same."''

''Glass does not have a precise freezing point; rather, it has
what's known as a glass transition temperature, typically a few
hundred degrees Celsius. Cooled below this temperature, liquid glass

retains its amorphous structure yet takes on the physical properties
of a solid rather than a supercooled liquid. ''

Source record: 34803

I just finished my latest project-a 5 band SW crystal radio. It was tons of fun, I have found myself getting more cautious and careful as I build more and more. This one was really fun, albeit expensive for a xtal radio rig, but "honey, it doesn't use any expensive batteries!" Boy, if I could just explain my Radio Shack bills now.

Anyway, for those who are interested, you can see my work at http://home.neb.rr.com/tdufres/econoceanic.html

As with any projects, your feedback/info would be helpful.

I have a few questions of my own. I use as the author suggested a powered amplifier/speaker (Radio Shack 277-1008C-5K ohms input impedance). Can one measure the "power output" to the amplifier, given an old Health 'scope, and minimal expertise with same, and has anyone else ever got selectivity improved? What about other types of diodes? I am currently using a 1N34A "Radio Shack 276-1123" basic.

Just a few ideas to kick around. What a real thrill hearing Deutsch Welles and Radio China last night!

The lawyers drove the decision not to give out schematics at APC. Everyone
in Engineering knew it was a simple matter to reverse-engineer a unit if
someone really wanted a schematic bad enough. Some of the Matrix power
boards were potted, but this was a safety issue and was only done as a last
resort as it made the boards unrepairable.

Nice looking job, you should be proud, of it and your web site. I built a similar one in the 1950s and use plug in coils using old tube bases as support forms. I even put up a 500 foot antenna to get more stations. One thing I notice in your schematic is the absence of a RF filter cap, I think I had about 100 uufd. That might help. I lived in Alberta and one time picked up HCJB and was elated. I finally gave up on the trying different cat whiskers and other detectors. My next set was a one tube super regen and it blew the socks off the crystal radio. With a 50 foot antenna I could nearly always hear HCJB pl;us numerous others. You can probably reuse your coils and go to the next step. After that it was couple more regens then converting WW2 surplus receivers. Now I'm playing with a Cubic R-3030A.

Beware of some bottles/jars, temperatures from the valve|tube could cause
it to (sort of) explode, especially if heated non-uniformely. If I
recall pyrex has a lower coefficient of expansion. Quartz and sapphire
are even better, but $$!

I would go with the lantern glass suggestion.

I agree that the lantern chimney idea sounds good. It seems to me that you could also modify a Pyrex beaker. These are available in a wide variety of sizes. I recall in chemistry class heating Pyrex to red heat with a bunsen burner, then forming it as desired. I'd think that with a little practice you could reshape or remove the bottom while leaving the rest of the flask intact. I recently saw a bunch of flasks on ebay -- I'll bet that beakers are common there, too.

I'd always wear safety glasses when messing with glass of any kind.

One thing that needs to be considered is the B+ available. The 50C5 family will deliver more power than the 6AQ5 at low voltages (<150V), since that's what it was designed to do, while the 6AQ5 will deliver more at higher voltages (> ~200). To get that greater output at low B+ the 50C5 family also needs about three times the heater power of the 6AQ5.

=========
Yes I'll try to get suitable lantern glasses for the few QY4-400 (similar
to the US 4-400) tubes I have.
On the other hand the chimney should NOT get hot because of the stream of
cooling air between chimney and tube.
Upon loss of air flow ,detected by a low pressure switch sensing the
pressure of the enclosed chassis below the tube ,the amplifier will trip. I
wonder if the tube (no longer powered-up) would still be able to radiate
sufficient heat to overheat the chimney (were it made from a jar) .
BTW the chassis will be pressurised by a suitable centrifugal fan previously
used for the same purpose.

Thanks everyone for the suggestions...i had totally forgotten the ole
6AQ5...it should fill the bill perfectly. Now if i could just find a
Heath gr-81 in the $10 price range.....

This is a very good point.

The 50C5 (and a few others) were designed specifically for use in cheap
radios that DIDN'T use a power transformer. They had to run the plates off
of rectified, filtered line voltage.

I was not aware that old stained glsss windows were thicker at the bottom
that top....
I do know that a long glass rod leaning against the wall will curve over
time and I also know that if you want to make a good glass cut after
scribing a line you better do it quick or the stresses will be relieved.
I'd be interested in how these 2 observations fit with the new theories of
glass. I'd sure like to know becasuse I took Materials Science in like 1963
and maybe there are better explanations..
My reolution of your nosapm email address may not work, but I tried..
tnx

>DJ / NM3R

I have a book with Avantek YIG oscillators from 1989. No such part number is listed -- maybe its a part number for a customer.

Most of the pin-outs seem similar. Here's an attempt at a description. Arrange the Osc so the SMA output connector is at the bottom (6 on a clock face). Rest of pins with approx locations by clock face times:

6:00 - sma out
8:00 - +15 V
10:00 - -5 or +5V
11:00 - +FM
11:30 - -FM
12:30 - +Tune
1:00 - -Tune
2:00 - Heater
4:00 - Heater

Some have a ground terminal at 3:00 or 9:00. Ground should be obvious because no insulation from case. Some have a ground off of the sma flange.

A few have no pin for -5 or +5V. Assuming yours has one I'd guess it would be -5V. I'd hook up an adjustable power source and measure current. Ramp it up slowly and see what current does. If current shoots up fast or doesn't move, you may have reversed connection. Specs for 4-8GHz oscillators I have listed are 60 mA on -5V.

I'd use the same technique for +15V. Different Osc listed in this frequency range draw 40, 150, or 200mA.

They will work without heater but it makes the YIG more stable. Most heaters are 20-28 VDC.

Current through the tune coil determines frequency. My listings show 15 MHz/mA or 20 MHz/mA, so tuning range for 4-6 GHz would be 266-533 mA. or 200/400 mA.

You can run without the FM coil or use it for fine tuning. Specs I have: 310kHz/mA.

I never heard of a YIG with more than 2 coils. I assume one of the things you measured is the heater. Comparing a similar device, 1 ohm would be FM, 11 Tune, 132 heater. The -5 or +5 connection is probably the biggest gamble. On all the listing I see for 4-8 GHz devices it seems to be -5V. Proper specs for your YIG would be better but if you feel lucky this may get you going. You don't know what it was used in, do you?

It's 'safer,' perhaps, to say that photons have _momentum_, because otherwise you start having to talk about 'rest mass' and otherwise start opening up various paradoxes. Hmm... I imagine I must have been asked to do it in a physics class at some point in time, but it'd be interesting to compute the force on your body exerted by a high power radio signal. :-)

> Does this means that when you walk

I always liked the idea that, hey, if you try to walk through a _closed_ door enough times, sooner or later (like, many many lifetimes of the universe later, statistically), at some point you'll make it through entirely via tunneling. Of course, far more likely would be that you end up partially inside the door, and that doesn't seem pleasant at all... :-)

I doubt it. These are mass-market items and techie-types who might want to repair their own unit are an insignificant percentage of the market. Believe what you want, but outside repairs affecting sales was simply not considered to have any significance.

Actually, they were tricky to fix, with lots of discrete components, control loops, etc. We had some amazing techs who could track down just about anything, but we also had lots of units where the fets blew up while attempting to repair them.

Maybe it's a matter of size - the 40KVA inverter that was installed at a local
telecom network lab came with complete schematics and parts lists.

Hi:
Just cleaned up the rig and it looks like someone has been here before. I put it on the bench and it seems like I have 117V AC practically everywhere. It looks like someone replaced some caps, and also the power cord, but nothing else. It doesn't "light up" or produce any sounds I have limited knowledge of things radio (see previous posts) but can perform minor adjustments. DO I need to just "tweak" somewhere or am I looking at a major restoration?
Your suggestions appreciated... Peter W are you out there?
Tom

That UPS is a capital investment, not a cheap, throw it under the
desk unit like 99% of the UPSs in service. And as you said, It came
with them. Equipment that is shipped without manuals generally means
you won't be able to get them.

Track down a full set of manuals for the L3-Com RCB-2000 telemetry
system, and tell me how many people you had to knock down to get them
out of the plant. They won't even give the test techs a full set of
size E schematics, and there is no service manual. If there was, it
would fill half of a drawer in a file cabinet.

You could also mask critical areas where you need metal contact, and
then do epoxy paint, perhaps with a primer.

Happy trails,

Sure, you can count photons with a photomultiplier tube if the rate is
low enough. You don't count every photon that strikes the
photocathode, generally, but you can see individual photon events.
>

Richard Feynman has some interesting comments about this. Try to
think of it this way: when you think of a "particle" you are thinking
probably of some solid thing like a billiard ball, and when you think
of a "wave" you are probably thinking of waves in water or something
similar. The problem with that is that electromagnetic radiation is
just electromagnetic radiation, nothing more nor less, and IS NOT
balls and IS NOT waves like in water. It is what it is, and behaves
in its own way. We have ways of observing it which we can relate to
"waves" and to "particles" but we must understand that those are
crutches for us.

He does a much better job explaining it...I think it's one of the
lectures in the series marketed as "Six Easy Pieces".

"Photons" of 1MHz electromagnetic radiation are extremely hard to
detect as individual events because they contain such a tiny amount of
energy; they are easy to detect at X-ray frequencies. As far as I
know (but I don't try to keep up with quantum physics' latest findings
so this may be wrong), we have not observed anything to suggest that
electromagnetic radiation comes in anything less than integral quanta.

Cheers,
Tom

The memory is blessedly dim now, but I seem to recall that one of the many, many scars on my butt is due to the unwelcome discovery that some iriditing processes result in a conductive surface and some in a non-conductive surface. It would be a good idea to check beforehand, unless you want another scar yourself.

Yes, it's the sixth "easy piece", "Quantum Behavior":

"Things on a very small scale behave like nothing that you have any direct experience about. They do not behave like waves, they do not behave like particles, they do not behave like clouds, or billiard balls, or weights on springs, or like anything that you have ever seen. . . Historically, the electron, for example, was thought to behave like a particle, and then it was found that in many resepects it behaved like a wave. So it really behaves like neither. Now we have given up. We say: 'It is like *neither*'"

Highly recommended reading.

Don't know if this will help any of you folks, but I recently tried to bulk erase a DAT 120 cassette, and had no noticable effect. I got the idea to place a large 'fender washer' under the tape, and the hand bulker on top of the tape. Presto! It erased like brand new. Tried this on some pesky CR02 tapes, and some metal tapes also. It works great.

Remembering basic chemistry that says bare Aluminum has an oxide layer on it
anyway, I would think that any form of surface treatment or coating is fine
provided any electrical connections are able to break the surface and contact
the aluminum underneath.

Yes, the oxide layer on aluminum is extremely thin (and brittle), and easily broken by just about any pressure at all. But iriditing and anodizing make a lot thicker layer, which can require a lot more effort to get through.

Most aluminum alloys can be "surface treated" for either an
insulating layer (anodizing) or conductive layer (iridite and
others). To keep aluminum chassis perky and conductive, go
to a chemical film treatment company in one's area and ask
them to do a conductive chemical film treatment on the finished
chassis. They will know what to do and how to do it.

If no chemical film treatment company in the neighborhood, just
sand down the scratches and buff it with steel wool until it is as
shiny in appearance as desired and let it go at that. That will
hold for years without developing any insulating oxide layers.

For protection of appearance - and to cover any decals added to
the chassis - a coat of petroleum-based varnish will protect the
non-contact areas. For decals and lacquer-based paints and
markings, do a very quick brush-over with varnish first to prevent
bubbling from reaction between varnish and lacquer. [test fly that
on some scrap first to get the hang of the method]

Can either of them withstand the teeth of a standard lock-washer? I know that even epoxy paint will crack and permit the teeth to grab the metal. Does the anodizing process linger long enough to affect bare aluminum surfaces that are exposed at a later time?

Chemical film treatments of aluminum, whether coductive or non-
conductive, are uniform and last for years.

Aluminum is curious since its surface oxidation (as in anodizing)
inhibits any further oxidation activity of the base metal. Ferrous
metals (except for stainless and such alloys) rust all the way
through. Brass, copper, tin can all oxidize all the way given time.
Aluminum surface oxidation is almost self-protecting.

Yes, enough force applied in a small area (lockwashers, etc.) will
cut through even the thickest oxidation films. Also most paints.

The chemical film treatments of aluminum are more cosmetic than
protective although they are protective for periods of a half century
to a century when exposed to exterior environments. If the
frequency is high enough for skin effect to be large, the surface
treatment may have to be something other than a chemical film.
That is usually at microwaves above 30 GHz or so.

If you really want pretty looking chassis of aluminum, go to a
good, versatile plating company and get "electroless" copper
plating on the aluminum, possibly nickel over that, with a heavy
chrome plating as final. It won't work any better but it will look
like a million bucks! :-)

I saw this suggested, but also to use double capacitance ratings since
the caps are essentially in series. I am not convinced that the "reverse"
biased cap would fully discharge in an half-cycle time period. What
is correct here?

Pete

I know that the oxidation of aluminum stops at the surface, but I was wondering if the anodizing treatment (or any other treatment) migrates or 'bleeds' over

time, kinda like oxidation on other types of metals. And is there any effect (corrosion) when aluminum is making an electrical contact with other metals like copper, tin or lead?

Many years ago I had a stability problem with an old 74ls123 monostable.
Changing the chip didn't help, nor did sub'ing caps. Finally I glued a
small
heatsink onto the chip with superglue. It settled down and worked fine.
Try heat sinking that sucker!

BTW I just got a sample of AD's new 9954. If I get my eyes to focus
that close
to the thing and find some real small solding tips for my weller, I might
try and see what this puppy will do.

Hi gang,
I just finished the "Improved Huff & Puff Stabilizer" from this site:

http://www.hanssummers.com/radio/huffpuff/rcdec97.htm

After a bit of playing with some values in the oscillator, I think it
is working correctly. It passes the 'hot breath' test nicely, no
noticeable drift after blowing a lung full of hot air over it.

More anon

To verify that, you should read the varactor voltage and see if it moves up (or down) as you breathe on it to correct the drift. I still think you'd like Pete Lawtons version better, but if the VFO frequency is not high, you probably won't notice the difference. Don't try moving your finger close to the VFO to test it, it depends on the drift being reasonably slow. (Which lung?)

>if the anodizing treatment (or any other treatment) migrates or 'bleeds' over
>time, kinda like oxidation on other types of metals. And is there any effect
>(corrosion) when aluminum is making an electrical contact with other metals
like
>copper, tin or lead?

I don't recall seeing any such "bleed" effect, even in old WW2 surplus
equipment...but I don't pretend to be a metallurgist, either. :-)

If in doubt, use stainless steel fasteners wherever possible with
aluminum main support structures. They last a long time without
much apparent degredation.

You may be thinking of some of the old, cheap TV antennas that
have been up for years and exposed to the elements...and suffering
all kinds of corrosion and embrittlement. Most of that comes from
the apparent use of very ductile aluminum (easy to manufacture)
and little or no surface treatment other than a light oxidation with
dye bath to give it that "gold" color.

My wife and I had our residence windows replaced last year with
vinyl-steel structures. The originals were "modular" aluminum frames
that had been there for 40 years (house built in 1962). Neither the
exterior nor interior surfaces of those modular aluminum window
frames had anything resembling "bleed" (corrosion spreading) other
than some cosmetic effects. Periodic steel wool rubbing would take
care of most such cosmetic surface oxidation. I've used one 8-foot
wide aluminum frame as an FM and SW BC "antenna" (insulated by
typical wood house structure) just by a solder lug and self-tapping
screw into the frame. That worked fine for about 30 years. :-)

In most military electronics structures involving aluminum, the
typical aluminum alloy for machined supports is "2024" type and
sheet-metal structures is typically "6061" type. Those seem to last
almost indefinitely as-is without much change in appearance. MIL
Specs on hardware call for stainless steel with that...or at least the
mechanical engineers I've worked with always called that out.

I'm sure there are all sorts of electrolysis effects that happen with
severe weathering such as in seacoast areas, salt from roads
treated for icing and so forth. Based on what I've seen and

handled over the last half-century plus, aluminum chassis with SS hardware hangs in there relatively as-is and no real degredation from oxidation or much else. If in doubt about something looking "terrible," whip out the VOM and measure joints...most of that terrible appearance is more than likely just cosmetic. :-)

Hi, I am searching for CATV tuner hookup data for the following tuners: EL683, TNV-76775F2,TEMH3-050A. These are pulls I took from VCR's. I am wanting to build a tuner-based spectrum analyzer, but I have been completely unable to find any tuner data on the net. Rumor has it that such has been self-censored as to not run afoul of scanner laws across the US, but these laws have ham exemptions so I don't see what the point of the censorship is. Failing any data for specific tuners, can anyone guide me to sites where I can find data for tuners that I can buy. Thanks in advance. 73, WA2JAZ.

Yup, it does. :)

> (Which lung?)

Right lung causes increase in freq, left lung decrease. ;)

There's an answer I hadn't thought of! Right lung contains air that's above ambient and the left one is refrigerated?

Huff n Puffs are remarkable. Old Klaas was really thinking when he came up with that originally. Hardly affects the phase noise, and stays put close to forever if you can stand the drift to the nearest lock point.

Regards, and congrats on the project.

Source record: 34711

I have a couple of identical inverters (generate 120 VAC from a 12V DC source. Each is rated at 400 watts. Seems to me I should be able to parallel their outputs to get 800 watts if I can lock them in phase.

Seems like I should be able to lock the phases if I go inside and rewire so that one's master 60 cycle clock/oscillator/whatever is controlling both of them.

Anybody done anything like this? Your thoughts?

Jerry W4UK

It's probably going to be more complex than simply locking the inverters in phase. If one puts out a little more voltage than the other then current will flow from the higher voltage unit into the lower voltage unit. It will become part of the load rather than part of the source. Whether that will do any damage or whether they will adjust to balance the load between them probably depends on the design of the inverter.

4210. Sunday Morn Capacitor Quiz...

Before beginning a project of my own, Ive been following alot of good advice from the web,and have been pracice soldering on old circuit boards, at the same time becoming familiar with the types and values of components. Several question were raised that I dont remember reading about, anyone out there know? O.K. Im looking at 5 capacitors, 4 of them are ceramic disk, the fourth is a green disk... what type are the green disks? All five have the numbers 27 on them, #1 just says 27, #2 says27 but is underlined,, #3 says 27 underlined w/ blue cap, #4 same but w/ yellow cap, and green capacitor has a purple cap. At first I assumed the underline was to ease reading the value, now I am not sure, is it significant?... I also remember reading about colored dot nomenclature, and colored stripes on some caps, but not about the "dipped" top. Tolerance code?
Thanks in advance for the education, hope I can repay you someday...

It's not uncommon for any kind of power supplies to be put in parallel, but you almost always have to isolate them from each other with a small value resistor. It isn't just a matter of frequency and phase, but also the output voltage and the slightly different regulation as well.

A couple of small resistors can cure a multitude of ills.

Veltex is the "loop" half of Velcro in sheet form. Glue a piece inside your briefcase/hardcase, then wrap a piece of double-sided Velcro (hook side out) around your QRP rig, tuner, power supply, etc., and stick 'em in the case. They don't move till you move 'em.

All I've found on the web is folks selling rolls five feet wide and 30 feet long for $120 and up. I need is a piece about 18" by 24".

Anybody know of anyone selling "cut to size" pieces, or at least pieces under 150 square feet?

Thanks,
-fb-

Just remember that the resistors will cause the output voltage to
become less regulated than the original supply. It all depends on how
tightly regulated you need the output voltage to be.

Really? I had no idea. Thanks. Durham's will be a dollar cheaper for a
pack of 4 T50-2's though.

Well, I have to ask a friend 80miles from here if he has the W2006
Pegelsender book, but I can't undertake the copying. So the solution
is to go to a copying shop and ask what they charge for the job. We
only used D2006 Pegelmesser at my work.The D2006 is many pages and I
have only read the German language text, but it may be some
explanations in English

Suppose the unit was made in the 70's

A suggestion: Try asking for the generic name of Velcro.

Michael's craft stores have it in many different sizes.

A form of it in strips is available in gardening supplies as
a tape (loops on one side, hooks on the other) available at
Lowe's and OSH (Orchard Supply Hardware). Green in
color, it may not support anything large but can be used to
tie coax to a mast (as an example).

If the transistors/MOSFETs already have current-equalizing resistors, it
shouldn't require any more. Instead of feeding a clock signal from master to
slave, just disable the regulator on the slave and drive it with the output from
the master's regulator.

Suppliers of outdoor fabrics may be helpful, although they mainly deal
with the tape form, up to 3" wide.

See this site for mail order suppliers of outdoor fabrics:
http://www.specialtyoutdoors.com/tips.htm

See the new ARRL publication, "Experimental Methods in RF Design", by Hayward, Campbell and Larkin, it's full of information, circuits, etc... on how to build top notch direct conversion receivers with modern Op Amp based phase shift networks complete with error analysis and sideband supression data, etc.

It ort to be very easy these days.

All you need is IQ out (just simple low pass filtered), and stuff that into the stereo line in on a modern PC (96dB dynamic range), a bit of software, and you have yourself a top notch any mode RX.

Could always buy a 24-bit stereo card if you wanted more dynamic range.

Clive

There are, however, a number of tricks to designing a good DC receiver in the first place. If it's poorly done, all the processing in the world won't make it good.

It's not necessarily harder -- or easier -- to make a good DC receiver than to make a good superhet. But the problems and solutions are different. I suggest reading any of Rick Campbell's work on the topic -- he knows how to make a good DC receiver.

Hi,

Just found a little schema I would like to build.
http://www.geocities.com/SouthBeach/3433/building.htm
(Not for Pirating! I'm studying for my HAM licence and I want to built it
for learning only!)

In it's final trap it needs the BLY88C, but I've called to several
components shops around,
but none of them sells them. They said that the BLY88C is an old transistor,
and isn't made anymore.

Maybe I could still get one if I wait terrible long ...

Now, is there any replacement for the BLY88C ??
datasheet:
http://www.semiconductors.philips.com/acrobat/datasheets/BLY88C_CNV_2.pdf

A little search brought me to the 2N3632, but I didn't check of this one is
availeble here in Belgium.
(http://members.tripod.com/~Malzev/comp/2n3632.htm)

I hope I will come out.

Kind regards

Gery D.

What's that all about!?

Any computer deletes his files by ereasing the name and start and end of the file in the HDD index file.
The actual data is still physic on your HDD, thats how undelete programs are working.
(scaning evry cluster to re-index your HDD!)
But if you write other files in the mean time on your HDD, the clusters with your deleted files in, will be
considered as empty, so it will be overwritten.

The solutions to make that nobody, even the FBI, can recover your deleted data is to defragment your HDD.
All the files will be placed nice next to eachother without spaces or fragmented files between them.

Yes and no.

The s/w is written in Visual 'something' and requires a DSP library from Intel(?). The library was free when the article was written, but now costs money. N4HY was complaining about that in a letter to QEX - but 'HY is very skilled in such s/w and could/should write the necessary routines. Maybe he will, he has the demo hardware boards.

Sorry, not a perfect world yet.

Source record: 34745

As they say, a picture is worth a thousand words. Any chance you could put a picture of them on your aol homepage or somewhere else on the web so we could see what they look like?

In general, though I can usually identify the capacitor type pretty well, specific characteristics are best found from manufacturer's data, and you may not have enough info to get that deep into it. It's possible to get a rude surprise if you assume too much. For example, if you use a non-temperature-stable cap in the frequency-determining part of an oscillator, chances are pretty good you won't be very happy with the performance. It's good to get an idea early on in your homebrewing about where you can make general substitutions and where the specific characteristics of a part are important. Can't say whether experience, elmering, reading or what will be the best way for you to get that feel for parts.

Cheers,
Tom

Hello,

I'm trying to build a helical resonator. In particular, I want to use loop coupling, to couple power into the resonator, and most text I have found on this has been a bit vague.
I'll be using a signal generator as the source, (50ohm) so I figured I'd want to take an existing BNC cable, cut off one end, and expose the inner conductor, twist that into a loop, and use that as coupling loop. I suppose I could just solder it directly to the helix and use tap coupling, but I'm not quite sure about the load so I think loop coupling would be best.
Anyway, what do I do with the loop? In particular, am I supposed to solder the open end of my single loop to the wall of the resonator shield? I noticed that this is done for waveguides. If not, then what do I do with the open end of the single loop?
Also, where do I place the loop. From what I've read, you're supposed to place it just below the cold end of the helix, and perpendicular to the helix axis. Also, should the diameter of the loop be the same as the diameter of the helix itself?
And while I'm asking questions, how should I solder the helix to the shield? In particular, what I've read suggests that you want a "low resistance joint". From what I've read, this means that I would want the surfaces to be mated to be clean. What kind of solder should I use, or rather, do I want to try to mate the copper helix directly to the shield, without using solder?
Thanks in advance to anyone who can send me some information on this. This is the first time I've done this, so sorry if the answers to my questions are a bit obvious!

> NEVER GIVE UP!!!!!

I love it! You guys don't see the FCC's plan do you?

This stuff is so incredibly broad banded that it will also affect Standard AM Broadcast, shortwave as well as over the air TV Broadcasts.

Ahhh, but if your rich, you can afford to buy a new Digital AM DAB receiver or XM Satellite receiver to listen to that dimwit Rush Limburger... and of course.....

We ALL have to buy that Digital HDTV if you wanna watch TV over the air or keep your old NTSC TV and pay for a Satellite or cable TV hookup.

Either way, you gonna have to spend money to keep what you got now!

See the plan now ???

No wonder Commissioner Powell jr is getting a big woody over this!

This one technology alone will FORCE everyone to go digital. Like it or not.

So just sit there, take it and don't say anything.

It's what they are hoping for.

>thanks in advance,
>
>Luis Rolo
>CT2INY
>OPO, PT

Luis, some relays will work very well on up to 1 GHz but it requires
a lot of inspection of the construction of the relay to see if it will
work or not.

Specific RF relays are designed for an absolute minimum of series
inductance. Some heavy power relays are made that way with the
contact assembly having no flexible wire to the moving contact.
Another factor is a near-constant low capacitance from the moving
contact to any other conductor plus very low capacitance between
contacts when the contact is open. The idea is to keep a constant
impedance through maintaining all conductor paths as uniform as
possible whether the contacts are open or closed.

An example of a rare surplus relay good for RF is some 28 VDC
coil designs found in aircraft electronics of the 1950s through 1960s.
These are easy to spot since they have a fully enclosed round can
having a flange mount with all connections to contacts and coil on a
glass-metal hermetic seal header. In the USA Allied Signal made
tens of thousands of those for military electronics. Their internal
contact structure is extremely short and the worst-case capacity
of an open pin to any other thing in the structure is 2 pFd (typically
it was just under 1 pFd). Contact sets typically made were 4PDT,
6PDT, and 2PDT.

The same general contact structure scheme was used by Hewlett-
Packard Instrument Division (now Agilent) a decade or so later for
low-power-handling RF relays. Extremely-short contact structures
with uniform spacing of the armature to the rest of the relay body.

As an example of the contact structure being short is the slide-switch
attenuator assemblies for low-cost 1-2-3-5-10-20-40 db switchable
coaxial attenuators. Those use older, very cheap-to-make slide
switches (not the DIP switch kind used in computer electronics)

which have very short uniform contact paths and are useable to
about 500 MHz before their discontinuities become apparent.
Note: Accuracy of attenuation there is limited by the resistor pad
choices, not the switching contacts. Such cheap slide switches
could handle 2 A at 115 VAC easily; 100 W in a 50 Ohm system
has a 1.4 A RMS current at 71 V.

Some of the home TV external switches might be suitable if
modified for a coil acuator instead of lever or knob. Those are
cheap but the construction style varies widely...they need to be
disassembled to see what is what inside. For the US market
they claim operation to 800 MHz, but makers seldom rate the
VSWR for any of those products. A relay or switch VSWR of as
high as 2:1 wouldn't make much difference in a system.

3-pole power relays could be used effectively in a coaxial system
if they have an absolute minimum of flexible wire to the armature
contacts with contacts side-by-side. Use only the center of the
side-by-side contacts and ground the contact poles on either side
of center. "Wasteful" of contacts, yes, but that insures uniformity
of all conductors in a stripline sort of structure. [yes, I've done that
and at higher RF power levels successfully up to VHF]

Tom, thanx for reply, its really no deal yet, just education, when I ran across the apparent same value capacitor I became curious as to whether an underlined value # actually makes it a different # (e.g. instead of a value of 27p, is the underlined 27 really 2.7p?) Same with the colored top, but you basically reaffirmed my thought that if I want to build something and have it work, especially my first time, I should probably go with a kit, or at least new components for a positive identification .

4247. Re: helical resonator

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-06-23 20:20:09 UTC
From: Skipp says its all rocket science <rocketmannotelton@yahoo.com>
Message-ID: <bd7ndphvf2@woodrow.ucdavis.edu>
Source record: 34600

General Rules of thumb Jason...

Make the resonator structure as rigid as possible.

One thought would be to copy a common bandpass cavity loop, it's size, construction and mounting. As an example, use a quarter size disc of metal; drill a hole in the center for (and mount) a chassis mount coax connector (your bnc as an example); make up a rectangular shape loop from number 12 solid copper wire. Mount the loop into the cavity by holding it captive over a large enough hole with three common 6/32 screws at the edge of the disc. You can rotate the loop for coupling when the screws are loose.

Too much loop size is not a big problem...
Too little loop size will show up as serious insertion loss.
Common examples from commercial cavities work... ie a 2.5 inch loop works for 445Mhz.

chow for now, good luck

1) AM IBOC is fragile enough that I think it would also be affected. And
may never get the stamp of approval because of how bad it sounds. And
because each station
occupies three channels. In itself, AM IBOC may kill AM for most people.

2) Limburger isn't on XM.

4249. RF Emission levels from Wireless LAN Equipment

How do the field intensity levels from a WLAN in a dwelling compare with those from a cell-phone tower site?

I want to compare emissions from this type of equipment, which Joe Public can happily buy at the local computer store and install in home or office, with the emission levels froom cell-phone sites, which are the source of intense public reaction whenever a new cell-phone tower is proposed in our community.

Does anyone one know of documented rf emission levels from Wireless LAN equipment, the sort of thing that might be used in a dwelling or office for computer interconnection.

Thanks

MikeN

Would the interference from these broad banded power line signals
disturb the digital signals as well as analog ?
I know the hdtv is higher up the the analog tv signals.

Hi!

I need some help with modifying a direct conversion receiver. This receiver has a crystal oscillator. As I don't want to change the XTAL for every frequency, I want to replace the whole oscillator circuit with a PLL synthesizer covering 5-18 MHz. As I don't know how to do a PLL circuit I need your help. May be you can provide me some schematics...
I thought about using an AD9850 DDS circuit but this seems to be a little bit oversized :-)

Thank you very much!

Yours,
Andreas Weller, DF1PAW

Source record: 34608

I strongly recommend reading Zverev "Handbook of Filter Synthesis."
If you are feeling flush with cash, you can buy it, but be prepared to
pay something in the $200 range. Your local library can obtain it on
inter-library loan for you, or you can find it in a university library
if you have access to one.

In any event, Zverev has a chapter on designing helical resonators and
discusses loop coupling. It's the only extensive printed reference
that I've found on helical resonator implementation of filters. (Not
that I've attempted an exhaustive search, mind you.)

Zverev will take you through the prototype filter design and then
converting it to a helical resonator. Zverev can be heavy going at
times, but the effort invested in reading it and working through
examples will be repaid in saved dead ends and wasted time if you
start off with experimentation.

As far as your specific question goes, if you are talking about a true
helical resonator, usually the feed is via a tap from ground, and you
will likely find that the tap is quite low, often a fraction of a turn
from ground. Coupling between adjacent resonators is usually via
capactive coupling through an appature near the the top.

If you are talking about a true cavity design, or a transmission line
cavity as is often used in VHF or UHF bands, the loop size depends on
the insertion loss desired, which is tied to the desired bandwidth.
But, at 150 MHz, a typical coupling loop ranges from 3/4" or
thereabouts to 2" or so long. But, I think you mean a helical
resonator, which uses taps, not loop coupling to get into/out of the
filter.

If you have a two-way repair shop in your neighborhood, I bet a visit
coupled with a kind request will yield a couple old helical resonators
out of a junked 150 or 450 MHz radio, so you can see how it is done by
Motorola or GE. Or, if that fails, you can order an inexpensive
helical resonator made by Toko from DigiKey and take it apart.

eBay commonly has SMA relays, from companies such as Agilent (HP),
Transco, dow-key, and others. These are typically good up to 8 GHz.

New, these things cost hundreds of dollars. Used on eBay, $25 or so.

Because of variations in how people name the things they're selling,
look for "SMA" and narrow your search from there. They usually appear
as SMA switches, SMA relays.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=2540905632&category=2
6211

lists a dow-key SPDT latching relay. I also saw some SP6T switches.

This auction is very useful for some of the comments it makes. These
relays aren't meant for "hot switching" of RF power. The power limits
depend on frequency -- 100 watts to 1 GHz, 50 watts to 4 GHz. If
you're switching more than 35 watts at over 4 GHz, you're way out of my
league!

You can also pull down a series of reference documents and applications
notes from Agilent website on RF relays.

Hi,

I am wanting to use a regenerative detector after downconversion.
Can anyone tell me how I can adapt a regenerative receiver to
use a crystal rather than an LC tank?

Thanks in advance,

WA2JAZ

From: Philip de Cadenet <Philstheboss@thebbc.fslife.co.uk>
Message-ID: <bqtL63UrtC++EwwN@philstheboss.freeserve.co.uk>
Source record: 34614

I am after any quantity up to 20 pieces of pcb mounted, right angles BNC sockets.

Now not the ordinary el cheapo's.

I require the type with a centrally located centre pin in relation to the four mounting pins.

Those that work in RF will know that the inexpensive connectors have an offset centre pin. I cannot use these.

I have 10 pre-drilled PCB's each requiring two connectors and I really do not wish to butcher these boards.

Come in Greenpar all is forgiven.

Can anyone help me with new or good used?

Tnx

Source record: 34616

Hi,

I'm looking for a easy to built FM (98-108 Mhz) radio circuit,
with at least 1W output, to broadcast my CD's or MP3 to any
radio around the house in good (stereo?) quality!

It must have an external audiosource (like: CD-player, PC, ...).

It will be my first homebrew transmitter, so I hope to get some
building explanations with the schema.

But with only a schema I would be happy to.

Kind Regards

Gery Duyck.

Hey, you have the same ads in your neck of the woods... Guess what i did,
Mr 807? I picked up a pair of 1625's at a flea (they're basically 807's
with 12V (annoying, huh?) fills & weird base), and re-based them with
regular octal bases, 'cos I only had *one* 7-pin base that fit them (came
from the back of an RCA scope toob) Used regular cheap-o epoxy as base
glue, and had them running all- out in a silly SE[fake]T stereo amp on a
0-30kHz sweep for half an hour - the epoxy holds... Thus far I'm running
tinto all the probs I run into with 6bg6's, and then some. In short, the
tubes talk to each other (there's about 2 inches 'tween them, and plate
wires are not shielded - sticking your hand 'tween them killse the
crosstalk), will oscilate at several MHz when driven hard at low freq's
(perfectlyy shaped oval RF bursts at the leading edge, minute changes in
wiring layout kill them - i'm thinkin' of trying RF chokes at the plate
caps - works with *other* sweep toobs...). Fred, I think your fave toob is
a *sweep toob*. Now, whatddaya' have to say to *that*, hmm? They shoo'
look right, though, real retro...

> As I don't know how to do a PLL circuit I need your help.
> May be you can provide me some schematics...
> I thought about using an AD9850 DDS circuit but this seems
> to be a little bit oversized :-)

If you don't want very high stability then a DDS chip together with a cheap non-compensated crystal oscillator reference would be the nicest way to go, if for some reason or other you need a sine wave output. Even for a digital PLL with loadable dividers you'll need to do some programming before it works.

http://www.dckits.com/plls.htm
http://www.minikits.com.au/kits4.html
http://www.minikits.com.au/tech.html#dds

You could also use something based on a cheap CD4046 phase locked loop, together with a resistor-and-potentiometer voltage divider on the VCO pin instead of the direct connection to the VCO pin - this should let you multiply the freq upwards, IIRC. I can't remember 100% sure if this really was how I did it once, but at least the 4046 datasheet and application notes should contain some further infos and schematics on the freq multiplier arrangement... But this resistor setup is not something you should do if you want freq precision...

regards,
- Jan

4266. Disable Speaker on Speaker Microphone for Handheld??

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-06-24 13:28:49 UTC
From: Dwight Stewart <stewart@say.net>
Message-ID: <BB1DCA50.1D607%stewart@say.net>
Source record: 34619
Cross-posted to: alt.ham-radio.vhf-uhf,rec.radio.amateur.homebrew

Is there a way to disable the speaker on a speaker/microphone in such a way as to return the audio output back to the radio's internal speaker?

I have a handheld that is often used on my desk and would like the audio to come from the better quality speaker within the radio rather than the speaker in the microphone.

Note: if it can be done, this modification has to be done within the microphone itself as the microphone connector on the radio is an odd one that I simply cannot find a connector to fit.

General advice on what to do is all that is really necessary (I can figure out the wiring myself is I have a general idea what to do).

Thanks for any assistance offered.

Cool! So you now have a 12BG6. Aren't very many of those in the world!

> Used regular cheap-o epoxy as base
> glue, and had them running all- out in a silly SE[fake]T stereo amp on a
> 0-30kHz sweep for half an hour - the epoxy holds...

Cool! I went the other way recently, and plunked a couple 832A's on
bases from dead 807's (even the toob world has organ donors), both sides
wired in parallel. So that basically gives me 807s with twice the Gm and
half the plate resistance. And a really odd-looking thing it is, looks a
bit like R2D2 perched on a garbage can.

> Thus far I'm running
> tinto all the probs I run into with 6bg6's, and then some. In short, the
> tubes talk to each other (there's about 2 inches 'tween them, and plate
> wires are not shielded - sticking your hand 'tween them killse the

I suspect that effect is related to the RF oscillation issue you discuss
next...

> will oscilate at several MHz when driven hard at low freq's
> (perfectlyy shaped oval RF bursts at the leading edge, minute changes in
> wiring layout kill them - i'm thinkin' of trying RF chokes at the plate
> caps - works with *other* sweep toobs...).

Yeah, that can help. Screen stoppers are very important, right at the
socket, with no bypass on the socket side of the resistor.

> Fred, I think your fave toob is
> a *sweep toob*. Now, whatddaya' have to say to *that*, hmm?

It certainly can be used for that. In fact, the original 6BG6 was just
an 807 plunked onto an octal base. They musta had lots of them left over
and were trying to find new markets. "Hey let's plunk it on an octal and
sell it to the TV guys! They haven't been around much, and won't realize
that we're pawning off war-surplus 807's on 'em."

Surely you've seen this:
http://www.dogstar.dantimax.dk/tubestuf/gzot.htm . I'd contemplated
entering it in the currently ongoing r.a.t. "ugly amp competition",
except that it's not an amp. Well, actually, the 807 part of it is an
amp... it's the 6C4 that's the oscillator. Hmm...

> They shoo'
> look right, though, real retro...

Don't they just? You gotta have bright red plate wires. CRT cable is
just perfect for that. btw- you can form it into shape using a hot-air gun.

Cheers,
Fred

> coupling would be best.
...
Though it's more usual to tap up on the helix for coupling, there's no reason you can't use a loop. Since the loop coupling is primarily magnetic, there is no need for the loop to share an electrical connection with the helical resonator structure. I would return the coax center (in the form of a loop) to the coax shield. Then you can position that loop in the resonator structure near the bottom of the coil and rotate it and/or move it in and out to adjust the coupling. Consider how the magnetic field of the helix must look to get an idea of the positioning of the loop for maximum coupling.

You could also adjust the coupling of an e-field probe near the top of the helix, or of a tap near the bottom by putting a small trimmer cap between the tap and the feedline. In the case of coupling through a tap or probe, grounding to the helix shield becomes important, especially for a tap low down on the tank. The tap position (coupling in general) will adjust the loaded Q of the resonator, and presumably that's why you are interested in being able to vary the coupling. Will you be coupling the output through an aperature to another resonator? You'll probably want adjustable coupling out of the second resonator, and adjustable coupling between the resonators, and you likely won't want to go beyond a two-resonator structure for your initial experiments.

Cheers,
Tom

You bring up a good point here. Though I'd expect 27 is probably 27pF
whether it's underlined or not, I can tell you for sure that something
like "470" could be either 470pF or 47pF...the latter being read as
"4, 7, and zero following zeros". It's a really good idea if you're
going to be doing much building to get some simple test equipment that
lets you actually make measurements of part values. You can build
your own capacitance measuring device, or buy an inexpensive kit.
Also nice to be able to measure small inductors as well.

Cheers,
Tom

Mijn doel is niet om te pirateren!
Ik wil eerst en vooral wat praktijkervaring opdoen over hoe zenders werken.

Het neveneffect van overal in en rond je huis je MP3 playlist te kunnen
beluisteren
is een pluspunt.

Ik ga immers in september het examen voor radioamateur gaan meedoen.
Misschien bouw ik dan later nog een 2m toestel.

Quite a few years ago I bought a really cheap (think it was $10) DVM
that has a capacitance measuring function, with just this purpose in
mind. It's perfectly adequate for the job -- and it turned out to be the
meter I use just about daily as a DVM, to boot. Capacitance measuring
capability is a fairly common "extra" on cheap DVMs, so it shouldn't be
hard to find a similar one.

Hello everybody...

I've designed a class-E AM transmitter using a circuit simulation package, and am now attempting to actually build the circuit, in spite of limited experience in sourcing components. As I've designed it, I'm driving the switch at about 8MHz, and as a consequence of the series resonance and high Q of the series-tuned branch of the circuit (~17pF cap in series with ~23uH inductor), I get a peak current of about 750mA (peak at 8MHz) through this branch of the circuit. The RF choke sources about 450mA of DC current from a 9V supply. Some of my many questions are...

1) Will I be able to implement and test this circuit on a breadboard?
2) Any recomendations on a good MOSFET for the switch? I have a bunch of IRF540s - will these work?
3) Any suggestions on where to get a leaded RF choke (say 25uH) capable of handling the required current at 8MHz?
4) The large current through the series-tuned branch results in a HUGE sinusoidal voltage across both the inductor and capacitor (almost 1000V peak at 8MHz!!!); will I be able to find a leaded tunable capacitor capable of withstanding these high voltage and currents? (All the spec. sheets I've looked at for tunable capacitors only describe a maximum DC current).

Also, I was hoping to use stranded wire to make the inductor/transmitting antenna in the series-tuned branch (a 10cm diameter air-cored pancake coil); can anyone offer any guidance on the necessary specs for the stranded wire (# of strands, individual strand gauge) and on where to get it?

Many thanks for any possible assistance,
HM

>
> General advice on what to do is all that is really necessary (I can
figure
> out the wiring myself is I have a general idea what to do).
======================
Having 2 HTs with external speaker /mike myself ,both have a dual 2.5mm
(stereo) / 3.5 mm (mono) combined plug to fit the HT.
The 2.5mm (stereo) type part is for the microphone and the PTT . The 3.5mm
(mono) plug part is for the loudspeaker

If you don't want to use the external speaker but wish to use the speaker
fitted inside the radio , you have to make a short lead with a piece of
audio (stereo) cable , a 2.5mm stereo plug and a 2.5 mm stereo socket.

Connect the lead to plug and socket and check that the 3 wires being
Mike -PTT - Common (screen) are correct

Plug the 2.5 mm plug into the HT and the 2.5mm socket into the 2.5 mm plug
part of the mike/speaker lead.
The 3.5 mm plug part on the mike/speaker lead remains unconnected.
On the HT the 3.5 mm socket for an external speaker remains unconnected to
anything external.

There you are

Good luck

Frank GM0CSZ / KN6WH

PS :If you dont like the above arrangement with an unconnected plug part on
the mike/speaker lead , you can fit a tiny box with properly spaced 2.5 mm
stereo socket and 3.5 mm socket to accept the mike /speaker lead plug and

connect the stereo cable bit via the box . Instead of the tiny box you can use a plastic or metal 35 mm photo roll can ....cheap and cheerful.

Dwight,

My speaker/mic connector is different from that of Frank's HT. I have 2 Santec HTs, a 144uP and a 142. Both take a mini 6-pin DIN with screw-on sleeve. I had to attack the problem from the mic. itself. I found an old micro-mini SPST slide switch from something long forgotten in my junk box. I had to drill 4 tiny holes in the mic. housing. One for each end of the switch for mounting screws, and two side-by-side for the slide. I dressed the two holes up with a micro-file, cut and prepped the wires going to the speaker portion of the mic., mounted the switch after checking the circuit for function and put the mic back together. Now, when I use the speaker/mic, I can turn the remote speaker off while the main speaker stays on in the HT, or turn on the remote speaker if I need to hold it closer to my ear in a noisy environment. The speaker inside the HT stays on all the time no matter what is done with the spkr/mic.

From: clutch@lycos.com
Message-ID: <vfhjomji220fa6@corp.supernews.com>
Source record: 34632

I just picked up a IC-706MK2G and with it being 95 degrees outside the thought of playing with it in the house rather than in the truck seems like a fine plan. Sadly, I don't have a 20A 13.8v powersupply. Guess I could buy one but it would seem that this would be a good homebrew project.

I would love to learn about shoestring homebrew solutions. Cheaper the better.

Hi,
Anybody got a cheap and dirty way of testing mrf150's out of circuit? My homebrew amp using 8 150's died, and some or all of the fets failed. At $50 a pop I don't want to throw away any that have life left in them. I did the usual static ohmic checks in circuit, and only identified one that looked bad. Also on application of dc bias, all 8 began to turn on. At very low power levels all 8 seemed to amplify, but with normal drive levels, no rf output. These are 4 push-pull sections with 2 fets per section.

Yes, it is a good homebrew project, but like everything else nowdays you can buy something cheaper than you can build. Radio Shack, and Samlex offer SMPS for under $100. May have to look for them on sale.
To build, you will need an expensive transformer, filter capacitor, full wave bridge rectifier, Series pass transistor, or Darlington array, plus various other components. I built mine, but I have a really big junk box.
There are projects in the ARRL handbook that will do what you wish.
By the way, if you only want to recieve when you are indoors, then things get quite simpler and less expensive.

One option that works for me is one of those gelcell powerpacks with
enough juice to start your car. They have a 17 AH battery inside.

If you are using high power for transmit, you may want to tap the
battery directly rahther than using the lighter outlet.

This covers what you want, plus you are set for emergency operations
from various locations, plus you can jump start your car.

About $50 if you shop well.

Happy trails,

==========
Wes , You don't need a 20 A power supply unit for this application . A much smaller unit would do in combination with a battery . I expect the radio to draw about 2 Amperes as an rx and while operating SSB at the nominal rated power of 100 Watts PEP , 7.5 -10 Amperes on average (if using speech compression) . Without speech compression the average current on transmit will be lower .
A current of 20 Amps is only required during power peaks . So ,with a 6-8 Amperes power supply unit set at 13.8 V in combination with a reasonable size Lead Acid battery ,you will be 'home and dry'

On the choice of battery , the best would be a deep cycle marine type . However with the battery continously connected to the live power supply unit a car battery would be quite acceptable.

Remains the choice of battery type from a ventilation point of view . A sealed or a no-maintenance battery can be safely kept in the shack near the radio . A battery which can be topped up with distilled /de-ionised water should be installed in a well ventilated area. The capacity of the battery depends on your operating habits eg tx duration /power /mode. With a supposedly rx/tx duration ratio of 50 /50 it will be unlikely that the average current drawn will exceed 8 Amperes.

So my questimate is a 6 amperes power supply unit and a 25 - 40 Ah battery wil be fine ,even for contesting .

Note : Use a good quality power supply unit with a clean 13.8 V - DC output fitted with an internal diode such that when the AC power supply fails , the battery will not drain via the PSU . When using an external diode (to be rated for not less than twice the max PSU current and fitted to a heat sink) the PSU output voltage should be set at 13.8 + 0.7 = 14.5 volts , 0.7 being the voltage drop across the diode.

Good luck

Frank GM0CSZ / KN6WH

PS: When using a sealed battery ,some people claim that the charging voltage should not exceed 13.5 V .
However ,today I checked a commercial battery charger for batteries powering electric golf carts ,which had its output set at 14.0 Volts.

4285. Re: helical resonator

Newsgroup: rec.radio.amateur.homebrew

From: jnguyen78@hotmail.com
Message-ID: <470559a8.0306241552.5f647f80@posting.google.com>
Source record: 34636

Thanks to everyone who has replied to this post thus far. The
information you've provided me has been quite useful. With regard's
to Tom's questions, no, actually I'm only interested in a single
resonator. In particular, I'm interested in the resonant voltage rise
at the hot end, but the design equations are the same as for helical
filters, and there's been much more information on the net on that.
Yes, you're correct in assuming that I want to be able to adjust the
coupling because I'm not entirely sure what the load on the hot end
will be like. I expect that the load will be mainly capacitive, which
from what I understand should shift the resonant frequency somewhat.
I had read about being able to adjust a tap with a trimmer cap in
series between the cold end and the shield, but I'd also read that
with both a probe and adjustable tap methods, there is no DC short to
ground.

Thanks again!

before i start making an adapter from scratch, has anyone made or know where a schematic that will adapt my kenwood thd7ag HT to use a standard headset as found on alinco, icom and radioshack HT's

the kenwood diagram i have uses the pins reversed (2.5mm for speaker and 3.5mm for mic) and the PTT is active by shorting the two grounds together

i plan on making a universal adapter set to use a commonly purchased headset/speaker mic with my kenwood TH-d7ag and yaesu ft-817.

> describe a maximum DC current).
a/ A huge voltage on a series circuit at resonance ? I would expect a
high current and small voltage as the series circuit should have a
small impedance at resonance.
b/ A maximum DC current of a capacitor is always zero :-(I expect it
is a typo
c/ You need a vacuum variable capacitor or a wide-spaced air one. See
e.g. http://www.mainlinegroup.co.uk/jacksonbrothers/5720.htm

>
> There you are

So, let me make sure I understand what you're saying. Broken down to its most basic level (the sentence above), leaving nothing connected to the speaker part of the connector will restore the radio's internal speaker? Is this true even if a connector is present but nothing connected to it?

My radio uses a four connection mini phone plug that screws onto the radio. When the external microphone is connected, the speaker inside the radio is disabled. The collars on the connector are speaker, ground, PTT, and Mic.

Obviously, there is no way to use another connector. However, I could cut the speaker wires inside the microphone to that part of the connector. Do you think that will do what I'm after - allow me to hear audio through the radio's speaker instead of the microphone's speaker?

My radio seems different from both yours and Frank's. My Yaesu VX-7R is has a four connection mini phone plug that screws onto the radio. When the external microphone is connected, the speaker inside the radio is disabled.

The connectors are speaker, ground, PTT, and Mic. Sadly, the manual says nothing about which goes to which pin on the connector, but that shouldn't be too difficult to figure out. Likewise, I have no idea how Yaesu has wired up the radio's connector inside the radio.

Obviously, cutting the speaker wires inside the microphone would disable the microphone's speaker, but that would probably leave me with no speaker at all. However, if I read correctly, Frank's message seems to suggest that basically disconnecting the speaker inside the microphone will restore the radio's speaker.

If this darn little microphone wasn't so expensive, I'd probably just tear it apart and experiment until I found the solution (or was convinced it wasn't possible). However, since the microphone is so expensive, I thought a message to this newsgroup might be a better way to go before I resort to more drastic measures.

A couple of helical filter links.

Looks like the 6meter version uses a loop for coupling.

==========
Indeed your HT is different from the older units I have. So you can ignore
my story.

Now knowing your model I'll try to find the external speaker/mike
connections.

It is possible that by plugging the speaker/mike plug it into the HT the
internal speaker is disabled through a mechanical switch inside the HT. Then
you have a problem.
However if disabling the speaker is done electronically by linking 2 pins in
the above plug , you could insert a short piece of cable with plug and
socket with the appropriate wiring connected which negates this 'connection'
.

I'll try to find the VX-7R circuit diagramme (somewhere ,perhaps on the NET)
and will come back to you .
Pse give me a few days.

4296. "Pi-L net" vs "simple Pi + step-up"

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-06-25 12:17:02 UTC
From: PaoloC <fake.address@asdrubale.net>
Message-ID: <3ef98b7d$1@news.opennet.it>
Source record: 34648

Hello.
I am in the process of closing my version of N7KSB's milliwatt transmitter (http://www.madisoncounty.net/~kj5tf/n7ksb.html), which uses a 74HC240 as PA.
It works on 30m, so I am basing my design on NORCAL's 38 Special (http://www.norcalqrp.com/kits/38spcl/38sch.html). I also used G4FGP's software to cross-check Pi-L values.

I am having troubles with the output filter/impedance matching network (Pi-L). I have no easy access to technical literature nor an oscilloscope, so I'm writing here.

My achievements so far: PA directly into 50 ohm gives some 10 mW RF on my meter (+25 mA @ 5V). But! PA with an attempt of Pi-L network, into the 50 ohm dummy load doesn't move the RF power meter, but draws +100 mA on key down. Currents are relative to key-up consumption of about 46 mA (yes, I am using a current-hungry design!). There must be some resonance in the Pi-L network...

First of all, can someone please tell me if the following is the correct way of using a Pi-L network? (ASCII drawing follows, view with a fixed-width font)

```
---+-- L1 ---+--- L2 ----
Z_hi C1 C2 Z_low
---+---------+-----------
```

I have seen some designs where hi and low impedance points are swapped. I'm a bit confused because in my understanding a Pi-L network is not a symmetrical quadripole. In my design Z_hi = 50 ohm (load/antenna) and Z_low is somewhere around 10 ohm.

In my first experiment I wound L1 and L2 over T50-2 toroids: do they give too much Q for this kind of application? Should I use air-wound inductors instead?
Should I plug some variable capacitors for C1 and C2 so that I can tune the network?

Second, is there any advantage in using a Pi-L network over a simple Pi network with a matching transformer (about 2:1 winding ratio in my case)? The number of coils to wind is the same, with the exception that the transformer might be a bit more critical (2 windings on one support) for the inexperienced builder. ;-)

With your kind feedback I will set-up a prototype that will be tested with an oscilloscope, but I will have a limited time-slot to use it, so I'd better do as many improvements as possible in advance.

TIA ES 72,
Paolo IK1ZYW

Do you have some links for the gell cells? I'd love to use a gell
cell and some circuitry to keep my radio alive when I start the truck,
also would like to be able to cross band my ft-8900r so I can use my
ht to hit local repeaters with no risk of draining the start battery.

In the first case, you're measuring all power out. In the second, presumeably the power ~ 10 MHz. They are most likely, significantly different. The primary difference between the Pi and the Pi-L from a operational standpoint is the improved harmonic reduction of the Pi-L. At high powers, this can be significant. At the power level you're contemplating, I doubt your harmonics from a proper Pi design will be troublesome to anyone else and it is easier to stay out of trouble making it work without test equipment if you stick with the Pi.

Go to the WB6BLD website and download the free software named Match2. It will do the design for you. In the case you have mentioned above, the Pi design is simply a shunt input capacitor of 710 pF, a series inductor of 0.355 uH, and a shunt cap of 710 pF to the load.

Regards

W4ZCB

You could buy just the gel cell, and set up the rest yourself. The
power packs, similar to what AAA uses, are sold at good prices in many
of the warehouse stores such as BJs Wholesale, CostCo, and Sam's Club.
I like the versatility, and my old car had issues with running down
the battery.

Cross-posted to: rec.radio.amateur.homebrew,rec.radio.swap,rec.radio.amateur.swap

Hello there,

Thanks for taking a moment to read this post.

I have for sale, an original Kenwood BS8 Pan Adapter Module; works with the SM-220 scope unit.

Comes with the proper cable(s) and works really well, turns out the used unit I bought actually came with one inside... much to the surprise of the previous owner and myself. So I have an extra, of which I bought for almost $200
The Kenwood SM-220 Manual shows how to install the unit, I can also supply a photo copy if asked nicely...

I'm asking $135 or a reasonable offer/trade.

Thanks

4307. VFO for Crystal Controlled Rig

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-06-25 19:59:23 UTC
From: Charles Cosby <charlescosby@execulink.com>
Message-ID: <vfjvosn6ohv068@corp.supernews.com>
Source record: 34659

Hello,

I bought an Icom IC-12A and instead of buying crystals for it would like to get a VFO. Icom made one for it called a DV-21 but I cannot seem to find one for sale. Would it be possible to rig a different manufacturers VFO to work or are they rig specific?

Thanks
Charles

I doubt any other external VFOs were made for the rigs. There were some made by companies called GLB and VHF Engineering. You might be able to find one of those but that was over 25 years ago. I built one of the GLBs for an old Regency crystal controled rigs way back then. YOu might as well chunk the old rig and get a new one for about $ 150 .

It was wishful reading on my part - it is 1.8
watts at 15 volts. It is on sale for 19.99.
Sorry if I got you excited at the prospect. It is
still going into the FT817 box. I plan to connect
it to my battery to add to charge when radio not
being used.

Charles -

The Icom IC-12A was a beautiful 2-meter base station (and not cheap in the 1970s).
They did not make as many of the DV-21 (also pricy) - but they do appear.

The Icom IC-22A was the mobile version.

Many of the crystal controlled transceivers of that era use 12.000 MHz crystals
and then multiply by 12. A higher quality DDS solution may work for this function.

The receiver is tricky - because the IF frequency has to be calculated for.

Browsing a Sears tool sale a few months ago, I stumbled onto a DVM deal that wasn't marked on sale,
but turned out to be the only thing I took home. It was a small, compact autoranging model with a
20pf-200mfd cap meter, 600vac/dc, 10amp ac/dc ranges, 10 megohm resistance, and a 10 hz to 10 mhz
frequency counter! It even measures temperature up to 1400 degrees with an optional probe, duty
cycle, has data hold, relative difference compared with a stored value. Has the rubber
impact-resistant case and a good set of leads with probes.All for $19.95.
I'm not sure if that was the usual price, but that's what it was marked and the price I paid. Made
in China, of course. The model number is 34-82139 in case anyone wants to go looking for one.

thank you for the precious help given.

I was able to buy a few used RF relays which specifications can be found at
http://www.dowkey.com/dk/products/164a.html , at a very reasonable price.
I think I have my problem solved. :))

Actually there was a VFO made for that 2meter rig, one of a very few models,
it was made in the time of transition from crystal controlled to internal VFO or
synthesizer frequency generation. In the IC21A you could either use crystals or
the outboard VFO, if you had one. It'll probably be hard to find now.

One thing to remember when buying, or indeed home brewing a power supply is that if you develop a fault on the pass transistors is you will cause an high voltage to appear at the output terminals (this could be as high as 27 volts, or more in some cases) so it is always best to have built in, or build in protection against this happening.
Other things to consider regards protection are, under voltage protection, short circuit protection, current limiting (not always required) and soft start (helpful if using a toroid type transformer).
I would never consider building a cheap power supply without all the protection I could build into it, it's just not worth it when you consider the price of the equipment you have connected to it.

Hope this helps a little, cheers, Ken, G4KIR.

Thanks for the extra effort, Frank. If you find a schematic, please let me know where. I've searched and did not found one. I wasn't exactly thrilled when I discovered this radio didn't include a schematic - the first radio purchased from Yaesu without one.

Which channel is he on?

I haven't found mention of him on the XM web site. I've found the listings
for what seems to be the righty-talk channel and he's not in the schedule
contained therein.

I surfed for quite a while and found many, many messages saying that
Limbaugh is NOT on XM, and only one that said he is. No details were given.

I wonder why N4HY said otherwise. Good news in any case.

Dick,
Look at www.flex-radio.com.

Gerald Youngblood has laid it all out including schematics,Visual Basic source code, and even a kit if you're so inclined. Very, very nice.

BTW, the Intel libraries are still downloadable and free for amateur use.

Nice unit.

The kits a bit on the pricey side but nice all the same.

Clive

Good point! I haven't thought of that. Still, there is something weird in
the current consumption.

Without Pi-L the TX draws about 70 mA (final connected directly to 50 ohm
load through Power Meter). I am certainly measuring the total power at "all
frequencies".

With the Pi-L the TX draws about 160 mA, and there's no visible power
reading.

Besides the power reading reduction, there is a huge increase in the current
input... I have most probably built a resonating Pi-L :-))

> different. The primary difference between the Pi and the Pi-L from a

Interesting, thanks.

> Go to the WB6BLD website and download the free software named Match2. It

That's a good piece of software. I downloaded both of them and I will play
with filters in the next days.

Thanks for the hints. Hope to catch you on the air!

I find that the mixer and detector to be more interesting than software to run the radio. I have tried many rig control programs and they do not give the "feel" of a mechanical dial. I have a large, almost instantaneous, dynamic control with a traditional dial versus mouse operations. ..

The dynamic range and selectivity of the radio (with a dial) are most important to me. The direct conversion quadrature detector seems to be the answer to those who do not want an Orion style price tag but do want the performance. If one is careful with the front-end bandswitching filters, preamps, and control circuits it seems that a very nice transceiver can be created at a very nice price.

Ahh, good idea!

I have a small 500w inverter hardwired onto mine for portable power.
I could pick up a set of 75amp powerpole connectors...

For me, there's no replacement for a large, detailed, warmly glowing
backlit dial. You can have a small LCD display for accurate tuning also.

4325. QST cancel the "right" of Equifax to reveal your credit to EVERYONE

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-06-26 21:07:04 UTC
From: Richard Clark <kb7qhc@attbi.com>

Act before July 1st to preserve your privacy.

Hi All,

Subject: Your Credit: Personal Information goes public

Starting July 1st, 2003, the four major credit bureaus in the US
(Equifax,etc) will be allowed to release credit info, mailing
addresses, phone numbers, etc., to ANYONE who requests it. If you
do not want to be included in this release of your personal
information,

you can call 1-888-567-8688.

Once the message starts
you will want option #2 - wait for the long silence to offer it!!!!!
(even though option #1 refers to this email, push #2)

Be sure to listen closely, the first option is only for a two-year
period.

Make sure you wait until they prompt for the option which opts you out
FOREVER.

PRACTICE this call at least once to hear the whole ball of wax
through. The message menuing is designed to obscure your options and
to muddy the water in their favor. It is heavily designed so that you
take the first less protective path (note, they approach this with
your ignorance giving them everything). Nothing will happen until you
are prompted to speak your name, and punch in your street address to
put the gears into place. PRACTICE this call to that point until you
are satisfied.

You should receive their paperwork in the mail confirming the "opting
out" in less than one week after making the call.

Then write your congresspeople and thank them for entitling these
agencies to stream your private information to ANYONE (not just
creditors).

I know they made a VFO for that rig. I ment there were not factory VFO's
made for any of the other rigs but a few of the Icoms. I saw that VFO about
20 years ago. Think it only covered 146 to 148 MHZ also (US version). I
was not sure if the origional request was for an Icom 12 or 21 and the 12
being a type. I did not remember an Icom 12 but it could have been a year
or 2 before my time.

I built a GLB unit for a rig of mine and installed a VHF Engineering VFO for
a ham in the local area about 25 years or more ago.

While a proper homebrew supply is fine, it is hard to justify trying to save
a few bucks on a power supply and frying a $ 700 or more rig.
But that is the way may hams are. People are that way in many things.
Reminds me of an old uncle of mine. He bought a new tire for an old tractor
. Said he did not need a new intertube for it as the old one held air after
putting on the 8 th patch.

Richard wrote, in error:
> Act before July 1st to preserve your privacy.
>SNIP<

Hi, Richard. Please make snopes.com a regular part of your reading day. Here's a particular URL:
http://www.snopes.com/inboxer/pending/credit.htm
with a particular quote:
Claim: The four major U.S. credit bureaus will be allowed to share your private information with anyone who requests it as of 1 July 2003 unless you specifically request them not to.

Status: False.

Example: [Collected on the Internet, 2001]

Just wanted to let everyone know who hasn't already heard, the four major credit bureaus in the US. will be allowed, starting July 1, to release your credit info, mailing addresses, phone numbers etc. to anyone who requests it. If you would like to 'opt out' of this release of info, you can call 1-888-567-8688. It only takes a couple of minutes to do, and you can take care of anyone else in the household while making only one call, you'll just need to know their social security number. Be sure to listen closely, the first opt out is only for two years, make sure you wait until they prompt you to press '3' on your keypad to opt out for good.

Origins:
...
However, it is not true that consumers must call this number before 1 July 2003, nor is it true that recent legislation allows credit bureaus to share private information with "anyone who requests it." This misinformation has been circulating since 2001, and the same message keeps getting get dusted off and sent around every year with an updated deadline. (In fact, if you call the number listed above, the first option you're presented is to listen to a message explaining why the e-mail quoted above is false.)

The entire page explains what the problem is and how the hoax keeps getting sent around. By the way, have you sent your business card to that poor boy in England who wants to have the biggest collection before he dies of a brain tumor? :-)

Hi
Can you help me out with some info

I have picked up a Roland DXY 1200 Plotter with no cables

The power in is on the side of plotter it has 3 pins marked 9.7v/31v dc
(like the back of a computer supply only smaller)
Is this the working voltage range or supply to each pin and a ground ?

I have not been able to find a manual for notes for it.

I hope to plot PCB with it

Thanks For your time

This fact is NOT a fact at all.

There is NO explanation at all. the FIRST option is, just I
described, an offer to allow you to withdraw for 2 years.

The SECOND option comes after some great length of dead air, long
enough to give every appearance of the first being the ONLY option.
The operator (a mechanical voice actually) zips through this quickly
to then offer:

The THIRD option is for you to RESCIND your opt-out, or to SIGN UP for
this benefit! It comes expressed in language tailored for your choice
over the quick skim of the second option.

It is quite obvious that if one were to follow the instructions, now
perpetuated by you, at the page you offer without regard to what was
being said, the individual would be blowing off their privacy. HENCE
my caution about LISTENing closely and doing it more than once!

Industry shills are working overtime, and I can see the makings of an
Option Roulette being played to good advantage - even here.

forgive me for the lack of a warm closing, you don't seem to have a
call, and you certainly don't have the facts nor the experience.

If you know the freqs required you might consider using our board at

http://www.qsl.net/ke5fx/synth.html

It has not been tried at 144 MHz (+/- offsets) but there is no reason why it
should not work with the relevant Minicircuits VCO and the PLL chip which
should be pin compatible with the board.
I would be interested in the outcome.

4334. Re: Help with Roland DXY 1200 Plotter

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-06-27 10:57:48 UTC
From: Joe McElvenney <ximac@btinternet.com>
Message-ID: <VA.0000003d.006f73a6@btinternet.com>
Source record: 34686

Hi,

The label on my power supply for the DXY1200 plotter states 9.1V and 31V DC at 700mA. The centre pin (top of triangle) is ground with the lower 9.1V supply going to the left-hand pin as you look at the plotter with the bed upwards. I measured the off-load voltages from my PSU and they were 14V and 40V respectively which suggests they are both unregulated.

As a result of your posting, I dragged my plotter out of the box where it has lain for 4 years and will have a go plotting PCBs in the near future. I have always used someone else to do the hard work but as I'm retired I'll have to get down to it myself. If you wish to swop notes, please email me.

Incidently, it will not be obvious until you switch it on but the DXY 1200 uses electrostatic paper hold-down - quite a dust trap.

Cheers - Joe, G3LLV

I'm looking for some large value variable caps... ATU project.

1/4" shaft.
one twin gang (could be 3 or 4 gang actually) each section 500pF (each
section 250pF if 4 gang)
one independant 500pF

or 3 500pF independant.

smaller physically the better.

1000pF cap's might be interesting to hear about for a 160m ATU.

I've tried ebay with some success with lower value but nothing
reasonable otherwise. Can anyone suggest a supplier (that doesn't
charge the earth) and will ship to UK or is in UK?

I a newbie to 1.5 GHz-range SMD PCB layout, so bear with me:

I'm working with 1/16th double-sided FR4. Bottom side is solid ground plane. I've got plenty of PCB area to work with. Parts are SOT-363 (MMIC), SOT-343 (GaAsFET), and 0603 discretes. (I can barely solder these by hand, any suggestions about using parts smaller than these grain of sand things will be laughed at.) No through-hole parts.

My circuit works, but now that I compare my design with commercial designs I have some questions.

Question 1: What's the best way to get a low-inductance vias to the ground plane? Lots of small-diameter vias, or fewer large-diameter vias? Or is it a non-issue? Does using wire vias as opposed to plated-through vias help or hurt? (Obviously in a mass-production design you don't want wire vias, but this is a hobbyist one-off).

Question 2: Would the answer to the above question change if I used 1/32nd FR4 instead? Obviously the 50-ohm microstrip sections would require less width, but I'm generally not lacking in board area. I'm thinking that vias in 1/32nd board must have less inductance than 1/16th board, but I lack a feel for the magnitude of difference. 0.3nH vs 0.6nH, maybe?

Question 3: Does it make any sense to put ground planes on the top side of the PCB in otherwise unused areas? (Assume lots of vias to the other side). I'm thinking about bypass capacitors for a GaAsFET source connection or MMIC power bypass. In particular I'm comparing NEC GaAsFET evaluation board
design (where the top has ground planes in otherwise unused areas and the bypass capacitors go to planes) with the HP evaluation board designs (where they use a small upper ground "strip" connected with extremely dense vias to the other side).

I'm just a hobbyist looking for some advice...

Tim.

They deliver to Sweden, so UK should not be a problem...

http://www.rfparts.com/caps4.html

(there used to be a German manufacturer/supplier, but they closed
down some 3-4 years ago. There might be 2:nd hand caps in
Germany, though...

GM Tim. The answer to the above is certainly! (Unused areas as ground planes.) HP, in their advice for SHF MMIC's is to use 0.010 double sided in that the significant inductance of vias thru thicker material is a source of instability at those frequencies. (Data sheet for the INA 02186 I believe) In addition to LOTS of vias between upper and lower ground planes to parallel the inductances, try copper tape (Stained glass stores) completely around the edges. Except of course, the gazintas and gazoutas. Then, connect the coax fittings to both sides of the board.

Source record: 34694

I'm about to construct a LF filter, with cut-off frequency about 2-3kHz.
I considered 8th order, by Butterwoth or Chebyshev approximation.
Butterwoth looks quite well - flat passband; but Chebyshev filter has an
improved roll-off rate. Nevertheless, the flatness is not ideal - up to
3dB up and down in passband. Does it affect the sound quality much? Is
it worth to obtain rough band instead of flatness?
Thanks for any info!

0603's are huge. Try some 0402 or 0201 things and you'll be grateful
for 0603's.

If you need a serious topside ground, the best way is to make a
topside copper island, as big as you can, and "rivet" it to the bottom
(or inner) ground plane woth lots of vias. Big vias if possible. This
is often done as a bowtie shape under an IC, to get good grounding.

Bigger vias are better than smaller. Don't use thermals.

Yes, lower L on thinner boards. 50 ohm traces are generally more lossy
on thin boards, but that's not usually an issue on small boards with
short traces.

If the top islands are useful (see above), yes. Just taking up space,
not doing real work, they probably don't matter.

If you're getting that kind of ripple, you've got the impedance way off.
Specify the termination Z and I'll give you a Tchebychev with essentially no
ripple.

I made the simulation of some filters crafted by different
approximations, and I noticed some ripple in Tchebychev, but they were
not matched. Now I cannot determine exact impedance yet, this filter is
going to be inserted after detector I think, or after another LF
pre-amplifier. What about employing an impedance repeater on single
op.amp? I could connect it anywhere and the filter will always notice
high impedance, or such impedance as I provide with simple 2-resistor
divider. Is this correct?

Here Richard will this help you to understand??

CREDIT REPORTING INDUSTRY ONCE AGAIN WARNS CONSUMERS ABOUT FALSE E-MAIL

Atlanta, April 16, 2003 Consumers are once again being advised by the credit reporting industry to be wary of a false e-mail circulating the Internet regarding the information handling practices of consumer credit reporting companies.

The false e-mail reads:

"Just wanted to let everyone know who hasn't already heard, the four major credit bureaus in the U.S. will be allowed, starting July 1, to release your credit info, mailing addresses, phone numbers... to anyone who requests it. If you would like to "opt out" of this release of info., you can call 1-888-567-8688. It only takes a couple of minutes to do, and you can take care of anyone else in the household while making only one call, you'll just need their social security number."

Contrary to claims made in the e-mail, credit-reporting companies do not provide personal consumer data to "anyone who requests it." Federal law prohibits such a practice. Consumer credit reports are only provided to legitimate businesses that have a permissible purpose under the law. Such permissible purposes typically involve the extension of credit, insurance, employment, or government benefit.

The toll-free number included in the e-mail is valid only for consumers who want to remove their names from mailing lists for pre-approved offers of credit lawfully generated by the major credit reporting companies. That opt-out number has been in effect and available to consumers since 1997.

The Consumer Data Industry Association issued three previous news releases noting the e-mail was false and misleading. Consumers can access the original release sent out in July of 2001 by clicking on "Media Room" at www.cdiaonline.org. The Federal Trade Commission (FTC) also issued a consumer alert in 2001 when this message first circulated to advise consumers.

--Source: Consumer Data Industry Association, April 9, 2003

And here is the link from where this info came from
http://www.equifax.com/corp/pressroom/pressreleases/2003/2003_04_16.shtml

Good luck too on getting all that money from Nigerian nephew of the former President that only required your bank acount number.

An op-amp will exhibit low impedance at it's output and you should be safe specifying it as 100 ohms or less and even terminating it in a known resistance around that value. You need to decide what the output impedance will be. You can resistively load a filter with a terminating impedance if it's going to feed a very high impedance, or specify what the impedances are to be, but they will determine the component values.

In actuality, your credit records pretty much _are_ available to everyone. It might be illegal to look them up or to use them, but it happens all the time, to the point where one company I can think of does a credit check on potential employees. Just because it's illegal doesn't mean that it does not happen regularly.

:-> Whoa, Dick! You are on a _rant_!

The URL again is http://www.snopes.com/inboxer/pending/credit.htm
and I have nothing to do with snopes.com -- it's an excellent resource for reading about hoaxes such as the false claim that credit bureaus can sell all our private information unless we opt out. In fact, the Fair Credit Reporting Act of 1997 contains limitations on who may request the information and for what purposes. The link I provide to snopes.com explains it all in plain English for those not so angry they've lost the ability to read.

And while you're (well, not you, Dick, but the other readers) at snopes.com, browse around and read about the online myths that a tooth left in Coke will dissolve overnight, the _true_ story of a medical student who discovers that an anatomy class cadaver is the body of his relative, the unfortunate hoaxes about children sick with cancer who will receive money/accolades/fame for every business card/email/birthday card/whatever that is sent to someone who is now being buried by unwanted mail or email. And be sure to search snopes.com for ManBeef. Or maybe not.

I also invite one and all to drop by my Website at
http://www.PhilipStripling.com/
and see if I've baited the trap for the unwary. :-> I'm sorry to tell you (well, not you, Dick, but you know that already) that it's not nearly as entertaining as snopes.com, but who knows you (er...) might find something interesting or educational.

Buh-bye, Dick. I'm sorry you're so freaked out over being led astray by the email hoax. You're not alone, though.

73, Dick!
Your pal,
Phil

So, I guess, having a filter I must evaluate the characteristic
impedance of the filter, to match it properly. But I've not found any
formulas including characteristic Z, I could only choose either constant
capacitances or resistances, and having a given frequency I could
compute R's and C's. If you'd direct me where I might find formulas
including Z(char.) I would be very graceful, or how to read out the
Z(char.) from the values of R's and C's of the filter.

Go to the WB6BLD website and download the student version of Elsie. Run the capacitor input LPF program but you'll need the termination impedances to complete the design. You get the cart before the horse not specifying the impedances first. I suppose you might effect a design with some specified impedance and then repeat that with another impedance and home in on whatever numbers you have for components, but there are a myriad component values that will yield the same transmission results, not sure you'd ever get there from here.

Actually, passband ripple is a design characteristic of all Chebychev filters. How much ripple is designed in just as much as the cutoff frequency. So if you want less ripple, specify that in the design.

If you don't want as much passband ripple but need a steep cutoff without a high order (and thus high precision and touchy) design, consider an elliptic filter which can move the zeroes to the reject band - or even have both passband ripple (which you can keep to an inaudible fraction of a dB) and in the reject band.

All of these have nonlinear group delay and ringing effects too. If that's important (example: if you will ever try to send encoded data through them), then gaussian and other phase controlled filters may be the way to go instead.

All of these can be implimented with many of the same circuits. Only the components vary. The design equations will help you there.

Filter impedance isn't the issue - the arrangement of poles versus zeroes is.

Best to you!

Jim Horn, WB9SYN/6

Hello Craig,

let me know how you go - I have a Roland DXY1100 I want to use for the same job - one of many long term projects hi hi.

Have done a bit of research and found that
1. You need a waterproof ink in your pens (this all assumes you are going to plot directly to the board)
2. Plotter pens ran out years ago, I have a good stock of HP (roland the same) pens but use water based ink.
3. The ideal solution is to use carbide tipped pens with refillable reservoir, however have not been able to locate any, at least not in VK.
4. One possible solution (but havent tried it) is to wash out the ink from existing pens and replace - it has been suggested that the ink used for ear tags on cattle is ideal for this - will hopefully try it.

The Roland plotters seem to be 100% HP compatible, they will use the same Windows drivers anyway, so in Protel just choose the plot HP option.

73 de VK3BFA Andrew

Let me know how you go, would be interested in swapping notes so we can both arrive at a workable solution.

More smaller vias generally works out better. It won't hurt at all to use
wire vias (such as AWG 22)...and such may work better than the
deposited-electroplated vias. If the via is solder-filled, their self-
inductance decreases.

>Question 2: Would the answer to the above question change if I used 1/32nd

>a feel for the magnitude of difference. 0.3nH vs 0.6nH, maybe?

It shouldn't make any real difference on double-sided thickness
layouts or performance. Use whatever is convenient.

To position multiple vias for the ground side of bypass caps, its
better to have them in a line perpendicular to the trace line.
That is better drawn than typed, but the idea is to have the
distance from end of a capacitor to all vias the same. That way
their self-inductance would be more in a parallel fashion and
thus less.

The REAL factor in some stripline structures is the ACCURACY of
line widths both in resolution and etching...but that is mainly for
structures such as directional couplers, power dividers, and
(especially) any filters. An uncontrolled stripline width of some
impedance will show a discontinuity where the physical width

changes.

>Question 3: Does it make any sense to put ground planes on the top side of
the

>and the bypass capacitors go to planes) with the HP evaluation board designs
>(where they use a small upper ground "strip" connected with extremely dense
>vias to the other side).

The usual answer is the "low frequency experience" one of yes,
use as much ground plane on the hot side of the board. I'd say,
from some slight experience, that it doesn't matter if the ground
plane side is continuous.

A stripline with a continuous ground plane on one side is ideal
for the concept of "flattened-out coax" structures not having the
original two-ground-plane microstrip. One has to think in terms
of "2-dimensional coax," not in normal lower-frequency PCB
terms.

>I'm just a hobbyist looking for some advice...

Well, I've become more a hobbyist since this so-called retirement.

>Thanks for any info!

Chebyshev responses can be anything in the way of ripple.
Generally, the more db ripple, the greater the stopband
attenuation.

If this is an application for speech filtering, there should be no
real problem in sound quality due to large or small ripple...the
sound quality is already altered by the cutoff frequency, any type
of filter.

Is there any evidence for that?

I'd always understood that since the via hole is so small, it acts as a waveguide beyond cutoff, so no RF current flows through the hole. (An alternative view is to think of the groundplane as a screen - you don't get any significant RF penetration through those tiny via holes.)

If you follow the surfaces where the skin effect makes RF current flow from topside to bottom of the board, it has to be inside the board: along the underside of the top layer, down the *outsides* of the vias and onto the inside of the groundplane layer.

Where filled vias do score is when you're using them to conduct heat through the board. Many surface-mount packages for MMICs in the >100mW output range have a slug of bare metal on the underside, which is expected to be soldered to a top copper island and linked through to the underside groundplane by lots of plated-through vias. The vias around the edge of the island carry most of the RF current, while those under the package carry mostly heat. In the soldering process, the vias become filled and conduct the heat much better.

Because the top island needs to be flat for heat-sinking purposes, this kind of layout is very difficult to prototype using wire vias. Unless you can remove all the excess solder and ends of wires from the top side of the island, to allow the MMIC to sit down flat, you're pushed towards having a prototype PTH board made.

>
Yes, there is a difference in inductance due to the lengths of the vias (strictly speaking it's the length/diameter ratio, but you would tend to use the same diameter of via for both thicknesses of board). The important thing is to avoid layouts where this difference is critical for performance.

> The REAL factor in some stripline structures is the ACCURACY of

That's the problem with thinner board - the accuracy requirements on
line widths are doubled.

On the other hand, the width of a 50-ohm stripline on 1/32nd (0.8mm)
board is more compatible with the width of SMD components and IC pins.
You don't have to neck the striplines down to insert something like an
0805 DC blocking capacitor, and this reduces impedance discontinuities.

Also 0.8mm board is very easy to cut with light shears or even strong
scissors, and small boards are quite rigid. Many PCB makers now offer
0.8mm as a standard option.

I'll also have some gunn oscillators to play with (ex security systems)
Most of them draw around 110 mA and give 10 mW (or 10 dBm)
But there is one that draws 100 mA but gives al�most no output (measured
with spectrum analyzer....at my job)

But i think you can sssume that with 120 mA it will give between 5 and 15 mW
(looked in a catalog of gunn diodes).
Also beware that the voltage isn't to low.(e.g. 4V).You can actually destroy
your diode)

Simon:

> does anyone have info ie power output of the C&K (sofan i think) gun
> oscillators?? draws 120ma at 6v.

Most 10 GHz alarm Gunns (I assume this is what you have ?) normally operate at higher voltages for optimal output (usually around 8V, where the current may be a bit less - remember it goes down with increasing voltage in as you approach the normal operating voltage). Most 8V/100mA Gunns have in the vicinity of 10mW specified output. Higher frequency Gunns often use lower voltages.

Many of these units have coupling screws which have a significant effect on the output power - I don't know if you have tried tuning them.

> also Racal i think gun oscillator (out of alarm unit...)
> marked 012G runs at 6v draws 24ma but seems to have higher output than
> C&K??? C&K not knackered (i have quite a few and they all are the same..)

I believe I have seen alarm units which use some sort of transistor or GaAsFET oscillator (rather than a Gunn diode) which could potentially be more efficient. I think that they were from C&K, but in your case perhaps the C&K uses a Gunn diode and the Racal doesn't. In the ones I saw, the "non-Gunn" consisted of a couple of parts on a very small PCB fitted with pins at each end to resemble a microwave diode package (same size as 1N23).

Hi Duncan,
While do not know a source- you might be better off to download one of the custom meter scale software programs and make your own scales- this gives you a lot of flexibility in purchasing meters. A Google search will turn up the sites.

Bob, KE6F is selling switchmode power supplies on Ebay. He's got bunches of
5V/20A supplies, selling in lots of 6 at $40.00. As he suggests in his Ebay
ad, you can arrange them in series/parallel and get a 13.8V supply at 40A.
They are somewhat adjustable ove about a 10% range, and they do indeed crank
out the power. I bought a set from him last year, and have them set up for
a bench supply. I have a switching arrangement that allows me to set them
up in series/parallel combinations that give me combinations of 5V/120A to
30V/20A. His latest offering ends today at 19:43 PST
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3032552663&category=4671.

Great price and you'll have plenty of power.

Duncan -

IF you are purchasing a large quantity - some mfg. with do this for you
for a graphic or "set-up" charge.

First, select a meter that is well supported for your application.

In the USA, the 2 manufacturers that I consider first for analog meters is:

Simpson Electric, Elgin, IL
http://www.simpsonelectric.com

Hoyt Electrical Instrument; Penacook, New Hampshire
http://www.hoytmeter.com

Here are web sites for customizing analog meter faces:

KR6LP's approach
http://www.qsl.net/kr6lp/meter.html

K8CU - from his QST article - on the subject
http://www.realhamradio.com/Meter.htm

There is no geographical restriction on samples.
See http://www.analog.com/productSelection/orderSamples/index.html

for instructions and one-time registration.

The devices that we offer (up to of any device) as samples
can be checked via the "Product Category Tree" at:
http://www.analog.com/Analog_Root/sitePage/productCategoryTree/

In the DDS section, none of the AD995x series are ticked yet - so no
samples yet being issued ecept to "lead customers" etc.
Quite often new/unreleased parts may not appear in the list of
available samples.

Not that I can reference in here, only stored in old notebooks at
Teledyne Electronics and RCA Corporation. :-)

>I'd always understood that since the via hole is so small, it acts as a
>waveguide beyond cutoff, so no RF current flows through the hole. (An
>alternative view is to think of the groundplane as a screen - you don't
>get any significant RF penetration through those tiny via holes.)

The operating frequency is mentioned as 1.5 GHz. For the average
via, the cutoff frequency would be well up into the tens of GHz.

When I've been mentioning "vias," I've been thinking of the through-
hole which is also plated-through to both sides. A plain hole through
to me is just a hole. :-)

>If you follow the surfaces where the skin effect makes RF current flow
>from topside to bottom of the board, it has to be inside the board:
>along the underside of the top layer, down the *outsides* of the vias
>and onto the inside of the groundplane layer.

Sorry, I'm not going to "follow it" that way. Having already been
through the mills and ground down, I treat the ENTIRE structure
within the enclosure as a cavity resonant at several frequencies
depending on the mode and location of excitation.

On a detailed level on a stripline (presuming "stripline" refers to
one groundplane on one side, the other type having groundplane
on both sides being "microstrip"), there's a rather complex EM
relationship which takes into account both the substrate dielectric
AND air, the substrate dielectric thickness, the copper foil thick-
ness, and the trace widths. That gets to be one #$%@^&!!!! mess
to calculate each time and I would take the much easier route -
use already-determined trace dimensions according to manu-
facturers' dielectric constant values and thickness and copper foil
dimensions.

There's a number of quite complex activities going on in any
stripline structure in everything from coax connector interfaces to

directional couplers to multiple-trace filters. That's lovely in the classroom but practically, it is much easier to just DO the thing according to others' information on how to do it.

If there's any worrying to be done, think about the ENCLOSURE. When the spacings within a stripline enclosure approach a wave-length (or multiple thereof), look out. In a memorable project some 26 years ago a complete dual Rx-Tx stripline assembly was put into an enclosure about 1 wavelength by 2 wavelengths. The results when enclosed didn't at all agree with what was carefully measured when the stripline was mounted in the open. At least four people, all of them rather experienced, blew it on not recognizing the resonances that could be set up several months ahead of time. [I did the overall stripline layout and couplers, dividers, and combiners] That included the chief engineer who led the regular design reviews. We cured the resonance effects by cementing in a thin layer of Emerson & Cuming "Echosorb" material...luckily there was still enough space within the enclosure. The absorber damped out some curious coupling paths due to resonances. It worked fine after that in the 0.9 to 1.2 GHz military IFF band.

>Where filled vias do score is when you're using them to conduct heat

>filled and conduct the heat much better.

Offhand, I'd think you worry a bit too much about heat. First off, if you have a high heat condition, what is the thermal resistance of the PCB material itself? Chances are it is lower than folks first realize. If there
are hotspots, such as a power transistor, why doesn't it have its own very low thermal resistance mounting to the baseplate? Okay, then, what is the comparative thermal resistance of an ordinary via made with normal methods versus the same one filled with solder?

Okay, where is the qualification in this case that "vias at the edge of the island carry the most current?" I've not seen the layout. Have you? Are the islands square, round, one trace going out or several? The analysis of RF currents in any simple stripline structure are sufficiently complex that answers to those questions need a commercial (expensive) EM analysis program. Actually, I think the "questions" raised are moot and not really needed...going off after a question quest for answers will probably exceed the ordinary project time manyfold.

>Because the top island needs to be flat for heat-sinking purposes, this
>kind of layout is very difficult to prototype using wire vias. Unless
>you can remove all the excess solder and ends of wires from the top side
>of the island, to allow the MMIC to sit down flat, you're pushed towards

>having a prototype PTH board made.

Sigh...if you've got a plated via and you need some heat transfer to
the ground plane side, just fill it with solder and be DONE with it.

Anyone mounting "large" SOT-23 packages with direct wire from the
component side leads to the groundplane should think twice. Leads
from that and the usual MMIC packages need some PCB trace to
solder to...to ground them directly can use a plated via or a through-
hole with wire that is soldered to the trace for the package lead.

Tiny SMT packages hold in better when the package is flat against
the board...and it is flat against the board when the leads are all as
close to the board as possible. That's a differnet situation.

>>>Question 2: Would the answer to the above question change if I used 1/32nd
>>>FR4 instead? Obviously the 50-ohm microstrip sections would require less
>>>width, but I'm generally not lacking in board area. I'm thinking that vias

>> layouts or performance. Use whatever is convenient.
>>
>Yes, there is a difference in inductance due to the lengths of the vias
>(strictly speaking it's the length/diameter ratio, but you would tend to
>use the same diameter of via for both thicknesses of board). The
>important thing is to avoid layouts where this difference is critical
>for performance.

Yes, I'm sure there is a nice paper waiting to be written on that
subject. However, how much difference does it make in an actual
project? Can you actually measure a fractional nanoHenry
difference?!? I wouldn't bother.

To approach some reasonable accuracy on measuring via inductances
is one heckuva large project alone and the only reasonable way to
approach it is to design some simple component and measure it as
carefully as possible. Then you have a duplicate but having some of
the vias mentioned and that is measured as carefully as possible.
Then one looks at frequency, VSWR, fractional db differences, and
suchlike. Not worth it. The actual differences are too small to
matter from a practical standpoint.

>> The REAL factor in some stripline structures is the ACCURACY of
>> line widths both in resolution and etching...but that is mainly for
>> structures such as directional couplers, power dividers, and
>> (especially) any filters. An uncontrolled stripline width of some
>> impedance will show a discontinuity where the physical width
>> changes.
>>
>That's the problem with thinner board - the accuracy requirements on

>line widths are doubled.

It's roughly proportional, yes, but HOW are you going to measure
the proper line widths? You can't eyeball it with a ruler. You are
going to need a magnifier with an integral scale. Now, IF you have
an error, what is the impact on the stripline system?

If a trace width widens to 40 Ohms or narrows to 60 Ohms instead of
50, is that a terrible thing? Not really. There are probably MORE
variables from other things that lead to discontinuities which are more
severe. Let us be practical here.

The absolute finished etch dimensions will make a big difference on
things like directional couplers and filters. It won't matter a great
deal on ordinary package interconnections.

>On the other hand, the width of a 50-ohm stripline on 1/32nd (0.8mm)
>board is more compatible with the width of SMD components and IC pins.
>You don't have to neck the striplines down to insert something like an
>0805 DC blocking capacitor, and this reduces impedance discontinuities.
>
>Also 0.8mm board is very easy to cut with light shears or even strong
>scissors, and small boards are quite rigid. Many PCB makers now offer
>0.8mm as a standard option.

A practical situation is to make the layout the best one knows how,
using known ways and dimensions, trust that the substrate manu-
facturer's dimensions hold, expose the photoresist properly according to
directions, don't over-etch or under-etch. Then MAKE the thing.

Gary -

Died? How?

I was taught that non-thermionic devices either worked
or did not. Several approaches:

A Fluke 860 is handy
http://www.hammondelec.com/gmmapp4.html

http://www.hammondelec.com/sample.html

The quickest method is a junction tester
Tom Gootee's web site (Curve tracer plans/kit)
http://www.fullnet.com/u/tomg/index.html

The major problem that I have found in solid-state amps is improper bias
OR cold/bad solder joints.

4379. Tektronix Test Gear Setup and Leader Curve Tracer

Newsgroup: rec.radio.amateur.homebrew
Date: 2003-06-29 00:24:30 UTC
From: Michael Melland <w9wis@charter.net>
Message-ID: <vfscdkabnc7i2c@corp.supernews.com>
Source record: 34531

I need to thin the herd on my test bench and it pains me to sell this but I need the cash and the room....

I have an " as new" ... I took it out of the plastic wrapper myself 5 years ago...

Tektronix TM-515 test equipment power frame. Complete with both covers (front and rear) and the tilt bail. This is the great Tek travel frame so you can safely transport and store the installed gear. Maybe a small scratch or two but I can't remember exactly where it is. These frames sold for $700+ new and Tucker has them well used for $350.

The frame will hold 5 ea single space plug-in instruments. Four instruments included.... and a Tektronix bay plate covers the empty slot (rare).

In the frame are the following plug-ins, most of these were $500 to $1000 + each when new:

DM501A - 4.5 digit DMM AC/DC/Current/dB/temperature with the temperature probe and a Fluke RF probe; last certified calibration by my local metcal lab (Fox Valley Metrology) in 2000/01- works perfectly and looks great. VERY nice and accurate... it's one of the only meters I've owned that reads my 10 Ohm lab standard exactly at the correct 10.06 Ohms....

PS503A - Triple power supply - Dual 20vdc 500 ma power supply with a static 5 vdc supply as well. Variable current and voltage for each supply. Works perfect and looks great. Checked by metcal in 2000/01. $400 alone now at Tucker !

DC504 - Frequency counter/timer 0.1 Hz to at least 80 MHz, 1 us to 999.99 s. Works perfect. One nick out of trim piece not really visable when in frame. Checked by metcal in 2001

FG503 Function Generator - low distortion sine, square and triangle waveforms. Six decade freq. multiplier steps, 1 Hz to 3 MHz. Can be swept 1000:1 with external voltage applied. Calibrated by metcal lab in 2001/02.

I think I have factory manuals for the TM515, DM501A and PS503A.... copies or parts of the manuals on the others as well.

This is a BEAUTIFUL bench set-up with about anything most of us could use.... and it's not crap but top line equipment. I'd like to see someone looking for nice gear buy it... or it's split up and off to eBay I'm afraid. I won't be giving this stuff away... too nice... I'm asking $500 plus shipping... and anyone who knows anything about this gear will tell you that it's a good deal. ... first one to say they for sure want it gets it...

Leader LTC-905 Transistor Curve Tracer.... NEW UNUSED perfect condition with manual and all cables plus the in circuit probe! I think they stopped making this 20 years ago... although it's a nice piece of test gear.

From the description in the manual:

"Curve tracing on a scope is made easy with the LTC-905. Characteristic curves of all types of semiconductors can accurately be displayed. This is far superior to the conventional ohmeter checks for quality. In circuit tests are possible for quick checks. Two inputs are provided which enable comparison of two similar devices. The LTC-905 is designed to test the following: NPN,PNP,FET and MOS FET transistors; SCR's - thyristors and triacs; Diodes - rectifier, detector, zener and tunnel"

Freq: 120 Hz
Voltage: 8 steps - 10,20,30,40,50,60,80,100 accuracy +/- 10%
Sweep waveform: fullwave rectified
Current: 100 mA max
Current limiter: 1000 ohms for low level trans
100 ohms for power transistors
Step generator Current : 7 steps - 10,20,50 uA, .1,.2,.5,1,2 mA - accuracy +/- 5%
Volts per step: .1,.2,.5 - accuracy +/- 5%
Power supply: 100,120,200,220 or 240 V 50/60 Hz 25 VA max
3.5" by 9.5" by 6.75" 4.5 lbs

http://webpages.charter.net/w9wis/ebay/ltc1.jpg
http://webpages.charter.net/w9wis/ebay/ltc2.jpg

$100 plus shipping.... I "may" still have the original box somewhere, If so I'll ship it in that. I bought this abt 6 yrs ago when a distributor went out of business here.... was NOS. eMail if interested.... or off to eBay later in the week.

I appreciate all the discussion, and this leads me to another question:
The pros who lay out consumer microwave PC boards must have some simulation
tools to tell them when the inductance to ground is "good enough", etc.,
maybe you just feed it the S-parameters for the components and it tells
you system performance (and analyzes for instabilities).

I'm presuming these tools must exist and let them lay out circuits that
aren't 90% ground plane. As a hobbyist or ham we have the luxury of
putting down a lot of copper when we aren't sure about something, but
the consumer GHz devices I've disassembled don't have any spare space!

Now, while I certainly cannot afford any of these simulation tools, I
still would like to learn what's out there. Can anyone give me some leads?

On a more primitive simulation note, I found some cool web tools that do
the textbook PC-board calculations. Like

http://www.emclab.umr.edu/pcbtlc2/

Source record: 34535

I'm just looking for any info how to design an elliptical filter - as
for now I'm not going to send or receive any data, so it should be a
good solution for my project. Unfortunately I cannot find how to make a
R/C/op.amp net, having a desired cut-off frequency. Order of the filter,
I guess as high as possible to make it reasonably easy to solder :) I
have only found a ready-to-build project with calculated elements'
values, which does not satissfy me much, unless I know how to calculate
them..
Thanks to all who replied to my previous post.

I used to have a circuit for genrating 3 phase signals using a 4017 IC
and some diodes, resistors, and capacitors. It was published in a
Electronics Design magazine back in the 80's. How ever in all of my
moves I have lost it. Does any one have a similar circuit?
Thanks, Bill Higdon

Snipped lots of digressions - about equally, mine and Len's - to get
back to my central point.

A typical plated-through via hole of 1mm inside diameter acts as a
circular waveguide with a cutoff frequency of about 150GHz. At
frequencies well below that, only very weak E and H fields can propagate
through the hole, which is the same as saying that negligible RF
currents can flow along its inside surface.

Since almost all the current flows down the *outside* of the plated
tube, how can filling the hole make any difference to its
self-inductance? Forgive me, but it doesn't seem to make sense.

Simon:

> ok how can i measure power out. i cant afford a spectrum analayser..

Spectrum analyzers aren't very accurate for power anyway (typically
+/-2dB for a modern one). I suggest you try to find another ham or a
university with a power meter (or spectrum analyzer if a power meter
is unavailable) and calibrate your diode detector against that. I
don't know if there is a UK ham microwave e-mail reflector where you
could find someone nearby, but at least a few G's monitor the WA1MBA
reflector (see www.wa1mba.org). Best to have an isolator or
attenuator in front of the as waveguide diode detectors generally are
not well matched.
>
> i havnt tried tuning with the screws as i assumed they are tuned for max
> smoke at the factory

Not necessarily. They may also have considered frequency stability,
and if there is a mixer diode integrated in the unit, the oscillator
power coupled to the mixer diode. Make sure you have a way of
measuring frequency before you tune the cavity tuning screw, however !

You might consider looking for an older model HP microwave power
meter. They can be picked up for relatively little, and are
significantly more accurate than a spectrum analyzer.

A quick check on eBay showed occasional prices below $100 for
servicable HP 432, 435B and 436A power meters, though they also
sometimes fetch prices significantly higher than that!

I'm sure there are other brands too, but those are meters that
I've used and am familiar with.

My father in law is using a soft hull inflatable (Zodiac) for fishing in summer in the Mediterranean. He has an outboard, a small 12V battery and a fish-finder. The cabling is very flaky and I'd like to set him up with something better.
As he is removing all equipment from the boat all stuff needs to be disconnectable. I'd like to Andersen powerpoles for all interconnections but don't know how these survive in a marine environment. The connectors will get wet with saltwater.

Has anyone some experience to share ?

Thanks Markus

Since Anderson Power Pole connectors are not water proof or even water resistant, I seriously doubt that they will fare well when exposed to salt water. My suggestion would be to check with a marine supply house. I notice that Boater's World, for example, has a variety of electrical connectors designed for marine use.

I'm still wondering how waveguide below cutoff attenuator
effects are going to affect a conductive via used as a grounding
path for a component on one side to the groundplane on the
other side of the stripline board. THAT doesn't make any sense.

As far as I'm concerned...and what I've experienced in lots of
years working with stripline, most of that at the low end of
L-band, is that a wider grounding lead works better. That
grounding lead is a conductive path at the operating RF. The
less inductance in that grounding path, the better. How do I
know this?

I've never had to measure the differences in vias, filled or not.
On prototypes the "vias" tended to be just pieces of wire

going through the board, soldered on both sides. Straight connections, short as possible. If in doubt of the number, use a lot of them. The "measurement" was on the closeness of the stripline component structure as a structure to the theoretical model that was the design basis. That's fairly standard in ordinary RF work, has been so for years.

You are welcome to go into the Whichness of the What on a good model approximation of such a condition which is going to be a rather lengthy discussion that goes beyond the pragmatic situation of homebrewers trying to get things going in their home workshop.

For one-of-a-kind stripline boards, few homebrewers can afford plated-through vias on boards...although the prices are dropping from various suppliers here in the USA. "Vias" generally are just wires from one side to the other. I've never had anything disturbing about such in actual practice, either for work or as a hobby.

Quite simply, it proves that the hole doesn't do anything. Therefore making the via solid cannot change its inductance (as you had claimed).

And make sure that the meter has the associated cable and head. The bare
meter is frequently sold with out the power sensor and cable.

I think I have encountered about every problem imaginable with this amp. This turned out to be a broken solder joint in the output filter of the amp. You are right about the major problems in SS amps.
With this problem, I could adjust the bias with no problem, so the fet's appeared to amplify, but when drive was applifed, no rf output. I reached the incorrect conclusion that I had 1 or more bad fet's.
Thanks for the links.

As long as the amperage is relatively low (ie non electric start ob), I would suggest looking into using trailer power connectors. They seal pretty well but are typically only in 16 ga wire (thus the low amp issue). My 6hp outboard has a charger on it, and thats what I have been using with no apparent problems.

At the risk of this sounding like a shameless plug, I would
suggest mil-spec parts rated for getting hit with water. I can think of
a couple of different inserts in the MIL-C-5015 series that are
completely splash-proof and salt-water resistant.

If your father-in-law doesn't mind dealing with a threaded
coupling on said connectors, they'd probably be ideal.

Here we go with the shameless plug (no pun intended) part: See my
page at http://www.bluefeathertech.com/connectors.html -- My local
wholesalers have most of the 5015 series in stock, so I can quote on
them (usually) very quickly.

I hate to be one to burst your bubble, but I had trouble moving a
very similar setup (though it didn't have the function generator) for
more than $100.00 at the last ham swap meet I was at.

If you really want to try and get $500 for it, your best bet is
going to, sadly, be Ebay. Even at that, I doubt it will go for much
beyond $300.

Just speaking from experience. I could be wrong...

If you are totally unfamiliar with them, do a lot of research first. A *great* deal depends on the thermistor or bolometer head, as Bill Janssen mentioned in his response. A unit offered without one is only a good buy if you can locate a reasonably priced head for it.

If you really want to get cheap, and old tube type HP power meter from back in the '60s would work well too! That should be _really_ cheap. The biggest problem with them was the temperature drift was so fast that calibration was difficult.

Is a solder-filled via sometimes known as a "thermal"? I've seen that
term a couple of times and when I think of it as you just described it
then the term makes sense.

Sorry if my questions went into esoterica rather than mainline. My questions
were almost entirely inspired by the differences in NEC vs HP (err, um,
Agilent) MMIC and GaAsFET evaluation board layouts. If the differences
are aesthetic rather than practical then I'll gladly drop the question.

> Then MAKE the thing.

I agree with you there :-). I hope to make more things soon!

My big problem is that while I have been succesful at making my own
SOT-23 patterns on PC boards at home (either photographically or by
knife), I have real difficulties with the SOT-363's that dominate today's
mass-produced parts and so far have been having expresspcb.com make
those for me. When I try to etch the SOT-363 pattern I either get too
much undercutting or don't fully etch out the tiny strips between leads.
ExpressPCB only does 1/16" FR4, but plated vias come for "free".

Tim (KA0BTD).

>like a fine plan. Sadly, I don't have a 20A 13.8v powersupply....
>I would love to learn about shoestring homebrew solutions....

I've run my entire 'shack from 12-volt car (and other) batteries for about 20 years. For charging I've used home-made chargers, a "float charger" (few hundrew mil's at most; $7.50 on sale from Harbor Freight) and a WalMart "battery maintainer" (1 or 1.5 amps, I don't remember; about $25), depending on how much/often I operate.

Many will scream "Don't use or charge batteries in your house", but don't listen to them! My local Hospital uses batteries by the dozen indoors, and I suspect yours does, too. I know because they give them to me when they swap them out from their portable X-ray machines, etc., every year. (After checking them out and sending those which won't hold a charge to the recycle place, I pass the good ones on to hams in this area). While they wait in my garage, I keep them "topped off" with Harbor Freight float chargers. Right now I have about a half-dozen 12-volt 26 amp-hour and two ONE-HUNDRED-TWENTY-volt, 4 amp-hour batteries (the latter are made of 20 6-volt batteries) waiting for takers.

Last Saturday I operated my own 100-watt Field Day in my grandkids' front yard using one of the 26 amp-hour batteries; even with four sub-harmonics all wanting to "help" me tune the radio, I contacted 32 states (my personal goal is maximum STATES, not contacts) in about five hours of operation using a ground-level automobile whip with radials.

(The above was also emailed to the original poster.)

No. A thermal via or pad is a pad that is located in, and connected
to, a plane, but there's an insulating ring that separates the pad
from its plane, with 3 or 4 small conductors, "spokes", crossing the
ring and making the electrical connection. The idea here is to reduce
the heat transfer from the pad to the plane, to make soldering easier.
This also increases inductance and, of course, thermal resistance.

Thermals aren't really needed, especially for surface-mount boards or
any boards that are soldered in a reflow oven, where everything gets
hot.

While this site does not give you specific formulas to solve, I think
you will find it interesting and helpful.

Jackson Bros are now owned by Mainline here in the UK.

They have a page up on the web showing most of their variable cap range.

However, their 4-gang 2000pf unit is not listed. I know, I'm after some.

I just tried finding the page but it's evading me right now.

750v working voltage seems to spring to mind.

Let me know what else you find as I am interested.

Zetagi make these, cheap.

Not sure who the UK rep is right now.

Do a search for the Italian company and back track.

There is a big difference between a lead acid battery as used in cars,
which can give off acid fumes or leak, and a gelcell battery, as used
for indoor industrial uses, such backup power for emergency lights,
computer systems, etc.

Gel cells are fine indoors, as long as you do not over heat or over
charge them.

Happy trails,
